## TIIE NORTII AMEIRICAN MUTHLLIDE.

BY WILLIAM J. FOX.
The following paper is the result of a short study of our Mutillidie, with a view to a classification of the genera. It has been my opinion for some time that existing classifications are unnatural, inasmuch as some of the genera at present indicated, have apparently no constant generic characteristics. In fact, one is almost convinced by an examination of the family that no really serious study has been made regarding it. If Smicromyrme, Sphuerophthalma, Photopsis and Pseudomethocu were held as valid genera it would be necessary to form one or two genera for forms which will not fit under those heads as now defined. Sphurophthalma sceva, pennsylvanica and curipilis are examples, which, in consequence of the mandibles, would be referred to Photopsis, but on account of the small ocelli are equally referable to Spherophthalma.

What have been hitherto supposed good characteristics will be found to vary in studying a series. The round eyes of typical Spherophthalma merge grarlually into ovate ones, and exotic species are known which have the eyes partly facetted. The dentition of mandibles in the female sex of that supposed genus is not constant. Usually there is a small tooth present within near the apex, but in many examples this will be found indistinct or ahsent entirely; in the latter case the mandibles present a falcate appearance. The only real difference in the mandibles is to be found in those species: representing Photopsis (as restricted by Fox and Ashmead), in which they are peculiarly and heavily built, being broadened at apex, which possesses either two or three teeth. But this characteristic is also found in three species otherwise referable to Spherophthalma (in the small ocelli, etc.). These species scera, pernsylvanica and uuripilis also agree with Photopsis in the unarmed first ventral segment and shape of marginal cell. Clearly these have as high a claim to generic rank as Photopsis. They are the evidence, in my mind, that proves the unity of Spherophthalma and Photopsis.

As to Pseudomethoca, that has not as much claim to generic rank as Photopsis. It has been defined as having two submarginal cells, two diseoidal cells, and with the marginal acmminate. That these
are inconstant characters is proven by our own species of Mutilla (sens. lat.). Considering the round-eyed species only (representing Spherophthalma), the number of submarginals is variable in the different species. Generally the third submarginal, if not distinct, is faintly marked; it is rarely as distinct as the second. This characteristic oceurs in species with the marginal cell truncate, and in some with it acuminate (propinqua, oceola) ; and we find species with two submarginal cells and a truncate marginal (fulvohirtu). The same type of mandible seems to exist in Pseudomethoca Cressonii and in Sphuerophthalma fenestrate, i. e., bidentate, or in other words, with a tooth before the apex on inner margin

It is not the present writer's intention to assert that the form and dentition of the mandibles are entirely valueless as characteristics; they can be used to some extent in separating the groups into which I have arranged Mutillu, as in the groups hexagona and scrupea, in both of which the dentition of the $\begin{gathered}\text { mandible differs. }\end{gathered}$

In the present work an almost complete series of the species of America, north of Mexico, has been available, including the types of Blake, Cresson, Ashmead and others, as well as a number of Mexican and South American species.

The author acknowledges with thanks the loan of valuable material from Wm. H. Ashmead.

The Mutillide is divisible into subfamilies as follows:

> FEMALES.

## MALES.

Tip of abdomen beneath supplied with two slender appendages.... Mntillinae. Tip of abdomen otherwise supplied.....................................Thynninae.

## 1. Subfamily Mutillinee.

This subfamily consists of one vast genus Mutilla Limé, of which twelve groups are at present known from the United States. Several of these have been described and given generic rank, but a study of them with a large series shows that such a course is not tenable, as they intergrade to an extent which renders a sharp line of demarkation impossible. Closely related groups will be found in both the tri- and bidentate mandibled series; thus the group asopus with tridentate mandibles is remarkably close to group occidentalis,
in which the mandibles are bidentate, and the other groups of the tridentate series seem closer to groups imperialis, hexagona, etc., than to asopus. A natural arrangement of the groups therefore is apparently not possible.

The American generic names which fall into the synonymy under Mutilla are as follows:

Ephuta Say = group occidentelis.
Mutilla (Limé) Blake $=$ groups hexagona, scrupea.
Agama Blake (subsequently changed to Photopsis Blake) $=$ groups imperiulis and anthophore.
Sphærophthalma Blake $=$ groups occidentalis. pennsylvanica, asopus, waco. camulensis, simillimu, grandiceps.
Photopsis Blake $=$ groups imperialis and anthophore.
Psendomethocu Ashmead = gronps simillima, canadensis.
Ephuta Say seems to have been overlooked by Blake when he named Spherophthulma, as it has priority. The groups represented by Pseudomethoca Ashmead are the American representatives of Myrmilla (Wesm.) André.

The groups into which the North American species of Mutilla are divisible are as follows:

## Mandibles tridentate in both sexes.

First and secoud abdomiual segments sessile.
Wings of $\delta$ rudimentary ; $\mathcal{F}$ thorax not crenulated.... Fr . grandiceps. Wings of $\delta$ normal ; $?$ thorax crenulated laterally.

No pygidium in $\oint$; wings with two submarginal cells.
Gr. canadensis.
A pygidium in $\ell$; wings with a tolerably distinet third submarginal cell.
Gr. simillinat.
First abdominal segment smaller than second, not sessile.
Wings rudimentary..................................................... . Gr. waco.
Wiugs normal. .................... . ...................................... ar. asopis.
Mandibles bidentate, or in some females edentate: if tridentate they are very robust and almost abnormal (groups imperialis, anthophore, etc.), and the teeth are situated at apex.
Eyes not emarginate anteriorly, rounded or reniform.
Eyes rom d, polished, not facetted; marginal cell truncate; mandibles not

Eyes irregnlarly rounded, or reniform; generally facetted ; mandibles robust in $\delta$.
Ocelli small, round, no pygidium in ¢...........Gr. pennsylvanica.
Ocelli large, the anterior one reniform ; $q$ with distinct pygidium.
First ablominal segmeut ( $¢$ ) smaller than second, more or less nodose; in $\delta$ the first and second segments similarly senlptured.

Gr. imperialis.
First and second abdominal segments ( $\wp$ ) sessile; first segment of $\}$ more coarsely sculptured thau second.......... (trv. anthophorie.

Eyes emarginate anteriorly, facetted.
First and second abdominal segments sessile...............Gr. hexagona.
First segment smaller than second, mure or less nodose.....Gr. serupea.
The female of group asopus is not known.

## 1. Group grandiceps.

Head large, wider than thoras, armed more or less with stout spines. Seape long and slender. Eyes subovate. Mandibles long and narrow tridentate, two small teeth being situated on imner edge before the acute apex. First abdominal segment sessile with second. No pygidial area. Thorax laterally ( $q$ ) not crenulated. Wings of mate greatly abloreviated, not equalling the thorax in length.

But one species of this group is known and is easily distinguished by the characters given above.

## 1. Mutilla grandiceps Blake.

Mutilla grundiceps Blake, Tr. Am. Ent. Soc., iv. 74. §, 1872.
Spherophthalma grandiceps Blake, ibid, xiii, 344, 乌 \}, 1886.
Texas. In general appearance this species is not unlike the agricultural ant Attu.

## 2. Group cantudensis.

Agrees closely with the preceding group, differing in the crenulated thorax of female and shorter, heavier mandibles. The male has the wings fully developed, with two submarginal cells, there being no trace of a third; the marginal cell is acuminate; eyes subreniform.

So far as known the males of this group have the body entirely black.
FEMALES.

Head more or less spined.................................................................... 2.
Head not spined.............................................................................. 4.
2. Postero-lateral angles of head dentate, the cheeks with a spine............... 3 .

Postero-lateral angles of bead bearing a carina, which terminates below in a sharp spine; abdomen from apex of segment 2 blackish.
canindensis Blake.
3. Head and thomax above, the former especially, covered with appressed, silvery pubescence; postero-lateral angles of head sharply dentate.

Toumeyi Fox.
Head and thorax without appressed pubescence: postero-lateral angles of head

4. Greater part of abdomen ferruginons, the silvery maculation, if present, thin, not very distinct
Abdomen black, except first and last segments, and the second ventral which are ferruginous; silvery pubescence dense, consisting of a transverse
spot at base and apex of second dorsal and two rounded spots laterally, and segments $3-5$ entirely; segment 6 with redrlish pubescence; tibize and tarsi blackish.

Wielknmi ('kll.
5. Second dorsal segment with silvery ornamentation
.6.
Second dorsal segment without silvery ornamentation, the pubeseence, if present, scattered, not taking a definite form. . . . . . . . . . . . . . . . . . . 8 .
6. Second dorsal with two rounded silvery spots. Length $3 \frac{1}{2} \mathrm{~mm}$.

## searolella Ckll.

Second dorsal otherwise maculated. Length $7-10 \mathrm{~mm}$ .7.
7. Second dorsal with a large basal and apical dark macula connected by a narrow line, thereby making the form of an hour-glass; the remainder of segment filled in with silvery pubescence; punctures of thorax coarse, but rather close, not running into reticulations posteriorly.
conneetens Cress.
Second dorsal with a transverse bar of thin silvery pubescence a little behind middle, which is extended near each side into a narrower stripe almost to base of segment, so $\perp$ _ thorax with distinct reticulations posteriorly . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . conininnax Cress.
8. Head densely covered with appressed pale pubescence: second segment ferruginous, with sparse silvery pubescence, that of thorax above sparse

Head with some sparse hairs; second segments bright orange, without silvery pubescence; thorax above almost bare medially, but bordered by silvery pubescence (scutellar scale large).
donse-anse Ckll. and Fox.

## MALES.

Head rounded behind in such a manner that no postero-lateral angles whatever are evident, roughly and densely punctured; punctures of hody coarse and rather close ; pubescence whitish ; wings fusco-hyaline.
ceryon n. sp.
Head transverse, the postero-lateral angles evident. the punctuation distinct; punctures of body not as coarse or close as in geryon; wings subhyaline.
.2.
2. Postero-lateral augles of head dentate; cheeks sometimes spined.
cansalensis Blake.
Postero-lateral angles of head obtuse. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 3 .
3. Legs comparatively stout; recurrent vein received by second submarginal cell near middle; head rather subquadrate, the punctures rather evenly separated.
gilat Blake.
Legn slender; recurrent vein almost interstitial with first transverso-cobital vein, or received by second submarginal cell at extreme base; head transverse, the punctures sparser and irregular......atifainass n. sp.
2. Mutilla Tonneyi Fox.

Sphærophthalma Toumeyi Fox, Ent. News, v, 297, \&, 1894.
Arizona: 'Tucson.
3. Mintiliniepliele $u$. sp.
P.-Ferruginous, sparsely clothed with pale hair ; flagellum from second joint fuscous; legs dark testaceous; second dorsal segment with two round spots of

TRANS. AM. EN'T. SOC. XXV.
JANUARY. 1694.
silvery pubescence; head quadrate, broader than thorax, with strong even punctures, the postero-lateral angles aente, but hardly dentate ; cheeks carinated posteriorly, the carina terminating below in a spine; thorax snbquadrate, subtruncate posteriorly, the punctuation stronger than that of head, especially posteriorly, where it is somewhat reticulate; first abdominal segment sessile with second, finely punctured ; second dorsal with distinct, even and rather close punctures, the second ventral with larger, sparse punctures. Length $3-4 \mathrm{~mm}$.

Texas: Brownsville, June (Wickham). Two specimens sent to me by T. D. A. Cockerell.

## 4. Mutilla canadensis Blake.

Mutilln (Sphtrophthalma) cumudensis Blake, Tr. Am. Ent. Soc., iii, 252, Y, 1871. Sphærophthalmu canadensis Blake, ibid, xiii, 248, ㅇ, 1886.
Spherophthatme alveolata Provancher, Le Nat. Can., xxii, 110, $\widehat{\delta}$.
Photopsis Cressonii Fox, Ent. News, i, 138. § (not Mntillu Cressonii Blake).
Psentomethoca Cressonii Ashmead. Tr. Am. Ent. Soc., xxiii, 182, §, 1896.
Mutillu neojerseiensis Dalla Torre, Cat. Hym., viii, 65, §, 1897.
Occurs from Canada to Texas. This species is entirely distinct from the Mutilla canadensis of Provancher, and from Photopsis canadensis of the same author.
5. Mintilla scaevolellat Ckll. and Cas.

Sphærophthatma scærolella Cockerell and Casad, Tr. Am. Ent. Soc., xxii, 198, ㅇ.
New Mexico: Las Cruces in May. Only the unique type seen.
6. Mutilla connectens Cress.

Mutilla comectens Cresson, Proc. Ent. Soc. Phila., iv, 387, \&, 1865.
Mutilla (Sphrerophthalmu) connectens Blake, Tr. Am. Ent. Soc., iii, 252, $9,1871$.
Sphærophthulma comnectens Blake, ibid, xiii, 245, ¢, 1886.
Lower California. Another specimen labelled "California."
7. Mutilla contmmax Cress.

Mutillu contumax Cresson, Proc. Ent. Soc. Phila., iv, 437, ¢, 1865.
Mutilh (Sphærophthalma) contumax Blake, Tr. Am. Ent. Soc, iii, 252, ᄋ, 1871.
Spherophthulma contumax Blake. ibid, xiii, 251, $\uparrow, 1886$.
Colorado; New Mexico: Santa Fé, July (Cockerell).
8. Matilla pracelarai Blake.

Sphærophthelma preclara Blake, Tr. Am. Ent. Soc., xiii, 25z. ¢, 1886.
Arizona. Another specimen in coll. U. S. Nat'l Museum from Sulphur Springs Valley, Arizona, May 9, collected by Hubbard.
9. Mitillat donge-anie Ckll. and Fox.

Sphærophthalma donæ--итæ Cockerell and Fox, Pr. Ac. N. S. Phila., 137, \}, 1897.
New Mexico: Las Cruces (Cockerell).
10. Matilla Wickhami Ckll. and Cas.

Spherophthalmu Wickhami Cockerell and Casad, Tr. Am. Ent. Soe. xxii, 297, ㅇ, 1897.

Texas: Houston (Wickham). Only the mique type seen. This species differs from the others in this group by the well-developed scutellar scale.

The following three species are known in the mate sex only :

## 11. Mutilta geryon n. sp.

§.-Black throughont, clothed with pale, erect pubescence, except on head above, where it is black; abdominal segments 2 -5 thinly fringed with pale hairs at apex; head with strong, confluent punctures, rounded behind, the postero-lateral angles not evident ; space between hind ocelli eqnal to about half that between them and eyes, the latter somewhat reniform; anteme about as long as the head and that portion of thorax anterior to middle segment; thorax strongly punctured, but not as closely as head; first abdominal segment sessile with second, with strong, separated punctures: second dorsal with the punctures more separated, those of second ventral somewhat stronger ; apical segmeuts with finer, though distinct punctures; wings fusco-hyaline, nervures and stigma blackish, the recurrent vein received by second submarginal cell near middle. Length 7 mm .

Missouri : St. Louis, August 28th. One speeimen.
12. Mutilla gila Blake.

Mutilla (Sphærophthama) gila Blake, Tr. Am. Ent. Soc., iii, 250, §, 1871. spherophthalmu gila Blake, ibid, xiii, 245, \}, 1886.
Texas. Only the unique type seen.
13. Mutillat aftallias n. sp.
\}.-Black, shining, clothed with thin pale hairs; legs not as dark as body, more brownish, comparatively slender; head transverse, with strong, widely separated punctures, postero-lateral angles obtuse, space between hind ocelli equal to less than half that between them and eyes: antenne about as long as head and thorax united; the first joint of flagellum distinctly shorter than serond : thorax with strong, separate punctures, those on mesopleura closest; middle segment reticulated, the retieulation largest above; first abdominal segment with large sparse punctures, not very broad, sessile with second, the latter with the punctures large, but somewhat closer; wings subhyaline, nervures and stigma testaceons brown, the recurrent vein reeeived by second submarginal cell at base. Length 5 mm .

California: Poway. One specimen.

## 3. Group simillima.

This group agrees with both the preeeding in the first and seeond abdominal segments being sessile, hut differs by the female possessing a distinet prgidial area, which is either striated or punctured, and by the large rombled eyes of male; this sex also differs loy possessing a third submarginal cell, which, while less distinct than the other cells, yet is easily discemible. Both sexes have a rather robust
form, and like the two preceding groups, the head is large, wider than thorax in the female.

The pygidium is more distinct in the species having it striated (ximillima, etc.). In harpalyce and brazoria it is not much more distinct than in the species of the preceding group.

## FEMALES.

Body with a more or less dense, appressed pubescence: pygidium not striated....2. Body thinly pubescent, nude in greater part: pygidium striated................ 4 .
2. Head, thorax and abdomeu above with dense fulvous pubescence, both appressed and erect, that on fifth dorsal segment grayish; pubescence of legs black

Hinvisilyce n . sp.
Upper part of body less densely pubescent, the erect hairs wantiug, that of the legs grayish, as well as that segments 3 and following......... 3 .
3. Extent of red ground color variable, the head, thorax and second dorsal generally of that color, with appressed fulvous pubescence.

Montivasy Cress.
Only the second dorsal red, with fulvous pubescence: head and thorax deep, black....................... . *montivagat var. (=brazoria Blake).
4. Head large, transverse, wider than thorax ; pygidium with longitudinal strixe
.5.
Head about as wide as thorax, subrounded behind; pygidium with diverging striae (femora reddish; no spots on second dorsal).........aetis n. sp.
5. Width of thorax anteriorly equalling the length of its dorsal surface : head very large, subquadrate; legs dark brown: second dorsal blackish at base, apex and laterally, medially orange, which color is sometimes divided by a narrow black liue, with coarse, romnd puuctures.
hippoalinmian $n$. sp. Thorax longer than broad; head transverse ; second dorsal not at all blackish, generally with two yellowish spots; punctures confluent; femora sometimes reddish.
simillinit smith.

## MALES

More or less reddish or yellowish
Entirely black
2. Second segment reddish or yellowish; thorax usually entirely black, though sometimes slightly reddish.
Abdomen entirely black, the segment thickly fringed apically with yellowish pubescence; dorsulum, scutellum and pronotum reddish.
propilnquat Cress.
3. Head, thorax and most of abdomen with black pubescence ; second segment reddish
4.

Head, thorax and legs with grayish pubescence; abdomen castaneous, second dorsal bright yellow, the apical margin of dorsal segments with goldeu pubescence. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . finvidia Blake.

1. Form stout: segments 1 and 2 castancous, the secoud dorsal yellower, both clothed with fuscous pubescence; femora fringed beueath with long whitish hairs. Length $11-13 \mathrm{~mm} . .$. . . . . . . . . . . . . . . oceolat Blake.
[^0]Form as usual ; abdomen, as a rule, entirely reddish, the color rather uniform throughont, segments 1 and 2 with pale glittering pubescence; femora sparsely pubescent. Length \& 10 mm................anbornii Cress.
5. Pubescence entirely black; pubescence black.......anthraeicolor D. T.

Pubescence entirely pale; wings subhyaline.....................agedon n. sp.
14. Mutilla larpalyce n. sp.

ㅇ.-Black, the head, thorax and abdomen above, except first segment, as far as fifth segment reddish and densely clothed with appressed and erect fulvous pubeseence as far as fourth segment; mandibles ferruginous, darker apically; fifth dorsal segment with pale pubescence; sides of thorax, legs and abdomen beneath with sparse black puhescence ; ventral segments $2-5$ fringed with grayish yellow hairs; head subquadrate, wider than thorax ; thorax not much longer than broad, contracted medially, crenulated and subtruncate hehind; first and second segments sessile; second ventral shining with large, scattered punctures, which are sparser basally; other ventrals finely and closely punctured ; pygidimm rugoso-punctate. Length 9-10 mm.

## California: Poway and San Diego. Two specimens.

15. Mutilla montivaga Cress

Mutillu montivaga Cresson, Proc. Ent. Soc. Phila., iv, 436, ㅇ. 1865.
Mutilla (Sphærophthalma) brazoria Blake, Tr. Am. Ent. Sac., iii, 255, Y, 1871.
Spherophthalma montivaga Blake, ibid, xiii, 254, ¢, 1886.
Sphærophthalma brazoria Blake, ibid. xiii, 254, , 1886.
Texas; Kansas; Colorado; New Mexico; Arizona. A very variable species, of which montivaga and brazoria seem to be the extremes.
16. Mutilla hippodaniat n. sp.

ㅇ.-Ferruginons, clothed, though not densely, with pale hairs; legs brownish : first segment and second dorsal at base, apex and laterally, fuscons, the latter otherwise orange, which color is sometimes divided by a fuscous line; head very large, subquadrate, wider than thorax, coarsely and confluently punctured, buccal carina sharp; antennæ fuscous from fourth joint, the third joint longer than fourth and fifth united; thorax short, subquadrate, its length abont equal to its greatest width, acutely dentate anteriorly at sides, rugoso-punctate above, sides crenulated; first segment sessile with second ; second dorsal with strong, rounded punctures, becoming much closer anteriorly; second ventral with coarser, sparser punctures; other segments compactly punctured, especially the dorsals; pgidium rugoso-punctate; all the segments fringed with silvery pubescence.

## Alabama; Louisana; Texas.

## 17. Mintilla simillima Sm.

Mutilla simillima Smith, Cat. Hỵn. Brit. Mus., iii, 62, $9,1855$.
spherophthulma simillima Blake, Tr. Am. Ent. Soc., xiii, 254, Q. 1 so6.
Florida. I have also collected this species in Southern New Jersey.

Three specimens before me from Florida are much larger tham the typical form, and the orange color of second dorsal segment is
confined to two rather evenly rounded spots. Otherwise they do not seem to differ.

## 18. Mutillat reetis n. sp.

ㅇ.-Ferruginous, tips of mandibles, antenare from third joint, legs, exeept greater part of femora, apex of first and second dorsal segments, blackish; pubescence of head and thorax sparse and black, on legs pale; all the abdominal segments fringed with pale pubescence apically, that on first dorsal interrupted medially ; head about as wide as thorax, strongly and confluently punctured, the postero-lateral angles slightly evident; first joint of flagellum about as long as following two mited ; thorax distinctly longer than broad. the punctures of upper surface larger and less confluent than those of head, sides scarcels crenulated; first and second segments sessile, second dorsal with rounded, separated punctures, from which project fine, appressed, golden hairs, which give the segments the appearance of being striato-punctate; second ventral with sparse, shallow pnnetures; pygidinm black, with radiatiug strice. Length 10-12.

Florida. Five specimens, one collected by Mrs. A. T Slosson.
19. Mutilla propintyat Cress.

Mutilla propinqua C'resson, Proc. Ent. Soc. Philat, iv, 433, §, 1865.
Spherophthetma propinqua Blake, Tr. Am. Ent. Soc, xiii, 242. \}, 1886.
Texas; Colorado; Montana; New Mexico: Santa Fé (Cockerell); Arizona. Perhaps the male of montionga.
20. Mutilla oceola Blake.

Mutilla (Nphærophthalma) oceola Blake, Tr. Am. Ent. Noc., iii, 248, \}, 1871.
Sphserophthatmu oceola Blake, ibid, xiii, 243, J, 1856.
Florida; Texals. This is certainly not the of of dubitata Smith, as ruggested by Blake (Tr. A. E. S., xiii, p. 243 ) ats it is in nowise related; it is probably the mate of hippodumia described herein.
21. Mutilla Sanbornii Blake.

Mutilla (Shærophthalma) Šahormii Blake, 'Tr. Am. Ent. Soc., iii, 248, \}, 1871. Sph ierophthalma sanbornii Blake. ibid, xiii, 243, \&, 1806.
Occurs from Massachusetts to Texals. Supposed to be the male of simillima.
22. Mutilla Mavida Blake.

Mutillu (Spherophthalma) flavida Blake, Tr. Am. Ent. Soc., iii, 249, §. 1871. Sphrophthalma fluvida Blake, ibid, xiii, 244, §, 1586.
Texas. Only the unique type seen. Sphorophthalmat volotilis Cameron, from Mexico, seems to be identical with this species.
23. Mutilla anthracicolor D. T.

Spherophthalmu anthrucina Fox, Ent. News, iii, 17: \}, 1892 (Nec Mutilha anthracina Gerstaecker).
Mutillu anthracicolor Dalla Torre, ('at. Hỵm.. vii, 9, §, 1897.
Califormia: Sim Diego. Only the unigue type seen.

## 24. Mintillat agreon n. sp.

b.-Black, rather densely clothed with pale, grayish pubescence, the abdominal segments $2-5$ fringed with it, the last two segments with black pubescence; head not as wide as thorax, subrounded behind, compactly punctured ; first joint of thagellom but little more than half as long as the second ; thorax with strong punctures, those of dorsulam being vers large and deep; first and second segments sessile, the second dorsal with large, round, separated punctures, the second ventral with large punctures, but not as regular as on second dorsal, remaining segments strongly and closely punctured, the punctures not near as large as on segment 2 , however; wings sublyaline, isidescent, nervures and stigma black, third submarginal cell tulerably distinct. Length $6 \frac{1}{2} \mathrm{~mm}$.

Arizona: Tucson, on Bigelovia Hartwegi (Tomey). One specimen in collection of U. S. National Museum.

## 4. Group wuco.

This and the following group agree with the preceding groups in the tridentate mandibles, but differ in the small first abdominal segment, which is not sessile with the second, and in shape approaching that of group occidentulis. The female head is not enlarged as in the preceding groups, and a distinct pygidium is present. The male, ats far as known, has the wings rudimentary as in M. grandiceps.

## FEMALES.

Black, the secoud dorsal segment scarlet, segments 3-5 also scarlet sometimes, if not, with black pubescence................................waco blake. Ferruginous; abdomen from apex of segment 2 black, with silvery pubesence; legs black............................................ hanrinoniat n. sp.

## MALE.

Only the male of waco is known ; it is colored like the female and has rudimentary wings; the second ventrad segment has a median carina terminating in at tooth beyond middle.
25. Mutilla waco Blake.

Mutillu (Sphxrophthalmnt) waco Blake, Tr. Am. Ent. Suc., iii, 238. , 1871.
spherophthalma wato Blake, ibid, xiii, :29, ¢, 1806

## Texas.

26. Mutillat larartoniat u. sp.
9.-Ferruginous; antenna, legs and abdomen from apex of segment, 2 black : head and thorax above with some sparse, golden hairs; second dorsal usually with four yellowish spots, the darker, ferruginuus, ground color in the shape of a cross; segments 3 and following witls silvery pubescence : a silvery spot at apex of second dorsal medially; thorax priform, coarsely punctured above. the sides deeply punctured; first abdominal segment smaller than second, not sessile with it ; second dorsal with elongate punctures; second ventral with large sejarated punctures, subcamated down middle; [rgidium rugose.

Pemsylvania: Philadelphia; New Jersey: Gloucester Cominty ; Florida: Jacksonville. Four specimens collected by C. W. Johnson.

> 5. Group asopus.

Differs from group waco in the fully-developed wings of male, which sex only is known. The marginal cell is broadly truncate, as in group occidentalis, and two distinct submarginal cells with faint traces of a third are present. Second ventral segment with a median carina terminating in a tooth.

## MALES.

Head and thorax more or less red, with reddish or fulvous pubescence above... 2. Head and thorax black, with entirely black pubescence (that of segments 3 and following black). . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .bexsir Blake.
2. Segments 3 and following with black pubescence...............asopus Cress. Segments 3 and following above with pale fulvous pubescence. Inector Blake.
27. Mutillat asopus Cress.

Mutilla asopus Cresson, Proc. Ent. Soc. Phila., iv, 43̄̄. さ, 1865. Spherophthalma asopus Blake, Tr. Am. Ent. Soc., xiii, 225, \}, 1886
Colorado. Blake suggests that either this species or hector is the male of regina, which is not likely, inasmuch as agina belongs to a different section of the genus, having bidentate mandibles.
28. Mutilla hertor Blake.

Mutill (Aphrrophthulma) hector Blake, Tr. Am. Ent. Soc., iii, 237, \}, 1871.
Sphærophthalma hector Elake, ibid, xiii, 225, \}, 1586.
Kansas. Probably represents a variety of asopus.
29. Mutillan bexar Blake.

Mutilla (Spherophthrlma) bexar Blake, Tr. Am. Ent. Soc., iii, 238, \}, 1871.
Sphærophthalma bexar Blake, ibid, xiii, 2e9, 今, 1586.
Texas. These three species (?) may be but forms of one variable species.

## 6. Group occidentalis.

Eyes round or irregularly ovate, smooth, not facetted, entire in both sexes. Mandibles not emarginate, either with a tooth within near apex, or falcate (edentate) in the females. Abdominal segment of female usually narrower at apex than base of second, but is not strongly nodose. Thomax of female varying from pyriform to hexagonal. Tibial spurs of female more or less serrated. Marginal cell truncate, the number of submarginals varying from two to three, usually with three.

The species of this large group represent most of those included by

Blake in the genus Spherophthulmu, and may he regarded as typical representatives of that genus. Blake's name Spherophthulmu is antedated by Ephuta Say by nearly fifty years.

FEMALES.
Thorax elongate or pyriform. ..... 2.
Thorax short, hexagonal ..... 31.
2. Thorax and abdomen, or the abdomen alone with dense pubescence, which, ismany species, is very long3.
Insect not deusely pubescent, frequently almost nude ..... 17.
3. Pubescence of thorax and abdomen coneolorons. ..... 4.
Pubescence of thorax and abdomen not concolorous. ..... 9
4. Pubeseence of body above very long, white or yellowish. .....  5.
Pubescence short, as a rule fulvous or reddish, in one species whitish ..... 11.
5. Insect entirely clothed with long white pubescence, inclusive of legs. .....  6.
Iusect with more or less black puhescence. .....  7.
6. Pygidium not longitudinally striated, ground eolor red gloriosta Sauss.Psgidium longitudinally striated, ground color black.pseadopappas Ckll. (var. of gloriosa?).
7. Pubescence of legs entirely black. .....  8.Femora and tibiæ more or less with pale yellowish pubescence.
8. Pubescence dirty white, pertaining sometimes to ochraceous.

Sackenii Cress.
Pubescence orange Sackenii Cress., var.
9. Keel of first ventral segment prominently produced anteriorly. size large. . 10. Keel of first ventral segment emarginate or bidentate. Length 10 mm .
zelaya Blake.
10. Pobescence of abdomen above varying from fulvons to castaneous; head and thorax with tolerably dense pubescence..................orens Cress. Pubescence of abdomen above pale golden yellow, that of head and thorax sparse, leaving greater portion of those places bare......ledat Blake.
11. Pubescence fulvous or reddish. ..... 12.Head, thorax above, except a black band mellially, two spots on second dor-sal, its apex, the third entirely, the fourth and fifth laterally, apexof second ventral, and third and fourth entirels with whitish pubes-cence, dorsals 4 and 5 with black pubescence medially, ground colorred...................................................... Siflıeliania Sauss.
12. Carina of first ventral segment prominentls produced anteriorly ..... 13.Carina of first ventral segment scarcely produced; head and thorax above.second dorsal, except basal third, third and fourth dorsals laterally,and fifth eutirely with golden brown pubescence, ground color ofabdomen black. Length $10 \mathrm{~mm} . . .$. .......................clio Blake.
13. Second dorsal blaek at base and apex, the fourth and fifth with red or fulvous pubescence, the process of first ventral segment rather acuminate.. 14. Second dorsal red, or entirely clothed with red or fulvous pubeseence, the fourth and fifth with reddish pubescence, the process of first ventral more or less truncate..................... ............................... 15.
> 14. Pubescence appressed, rather short and silky, usually scarlet, thonglu sometimes paler. . . . . . . . . . . . . . . . . . . . . . . . . . . . ocecidentalis Limné. Pubescence erect, tolerably long and coarse, pale fulvons.
> coninanche Blake.
15. Segment 3 and following entirely black, or the third sometimes with some fulvons pubescence. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 16.
Segment 3 and following entirely, or at the sides with pale pubescence, ground color variable, the second dorsal, however, always reddish or fulvous; pubescence of body above varying from pale fulvous to a deeper red.
seginat Cress.
16. Gromnd eolor castancous, second dorsal fulvous; head above entirely with reddish pubescence. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $\boldsymbol{r}$ ensit Cress.
Ground color black, second dorsal fulvous in part or black; head on vertex with reddish pubescence....................crusit var. (=medeal Cr.).
17. First segment almost sessile with the second; head at most scarcely as wide as widest part of thorax, more or less narrowed behind............ 18.
First segment rather nodose, rarely otherwise: head large, fully as wide or wider than widest part of thorax, subcuadrate, not or seareely narrowed behind
18. Second dorsal segment black in greater part ..... 19.
Second dorsal reddish, as well as greater part of insect ..... 20.
19. Second dorsal with two or four rellow spots; apical margin of segments fringed with silvery pubesceuce; legs nsually red but varying to black 4-gutitatal Say.
Sceond dorsal not macmate, or with a faint trace of spots; abdomen witlsoutsilvery pubescence, or the ventral segments may be fringed with it:
:20. Head ronnded belind, not tuberculate ..... 22.
Head with postero-lateral angles angulate, carinate or tuberculate ..... 21.
$\bullet 1$. Postero-lateral angles of head acutely angulate, the first segment dentate on the sides medially anguliceps $n$. sp.
Postero-lateral angles of head bearing a short carina or elongate tuberele ;first segment not dentate on the silles medially.......eypris Blake.
20. Head and thorax with a dense, hoary pubescence, the entire insect sparselyclothed with erect, pale hair; abdomen entirely red, except apex ofsecond dorsal, which is blackcanco Blake.
Head and thorax searcely pubescent at most with some erect hairs; apicalabdominal segments black entirely or in part23.
23. Carina of first ventral segment produced anteriorly into a stout tooth (leg.black)terrugatin Fabr:
Carina of first ventral segment emarginate medially, so that it bidentate24.
21. Second dorsal segment conrsely sculptured thronghont ..... 25.
Secomd dorsal segment punctured, spatsely so betreen the middle and sides,so that it presents two large, rather smooth areas, which are paleyellow: thorax verv eoarsely rugose, the heal strongly punctmred.Length 6 mm.. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ringilasin n. sp.
25. At most the head and thorax with sparse, golden pubescence; second dorsalnot rugosely punctured at hase, its apical silvery band entire. . . . . 26

Head, thorax and second dorsall segment clothed with a glittering, appressed. sparse, golden pubescence, the second dursal rugosely punctured at base, its apical silvery band divided into three parts; head more quadrate than in the allied species, tending somewhat to that of the textma, scarvola, etc., section
spars:a n. ip.
26. Legs black or piceons; entire insect clothed more or less with an erect, pale pubescence; head with a close, confluent, coarse punctuation.
vestal Cress.
Legs red ; insect with scarcely any erect pubescence, except in certain places: head with a strong, separated punctuation.......... sapplon n. sp.
27. First segment with the hasal productions dentate ; punctuation not umusually coarse
28.

First segment with the hasal productions lamelar; punctuation unnsually coarse, the thoma and second segment deeply pitted; head and thorax black; abdomen castaneous, pertaining to rellowish on seeond segment.

Hhei Cress.
28. Postero-lateral angles of head unarmed......................................... .29.

Postero-lateral angles of head carinate (reddish; legs black; second dorsal with two pale rellowish spots).... ..............carinieeps in. sp.
29. Head and thorax black or rufo-piceous, legs darker; secoud segment red. with appressed, orange pubesrence above: apical segments dorsally with long black hairs, and fringed above and bencath, more or less, with pale pubescence..................................... 1 exanat Blake. Insect ferruginons. . .............................................................. . . 30.
30 Coarsely sculptured throughout, sparsely clothed with long, pale hairs; legspines very robust, as well as the legs themselves: first segment prominently nodone, with a silvery spot at apex; second segment usually with paler spots..............................scaevola Blake. Scolptured as nsual, about as in ferrugata, vesta, ete., scarcely clothed with pate hairs; less slender, the spines delicate in comparison to scerola; first segment more as in ferruguta, etc., not matculate : serond segment unicolored ; dorsals 2 at apex, and $3-5$ medially, with a silvery spot.

Bolliin.sp.
31. Head at most as wide as thorax, usually not as wide.......................... . .

Head wider than thorax. ......................................................... . . . 41.
32. Pubescence whitish. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 33.
l'nbescence colored otherwise. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 34.
33. Pubescence above long and white, beneath and on legs back, ground color black or piceous.................................elytemmestrat n. sp. Pubescence of entire body, incloding that of legs, long and white, ground color reddish.
thetis lmake.
34. Body clothed with a close, appressed, short prbescence, and some much sparser, ereet hairs (in one species wanting).......................... 35 .
Body clothed with coarse, long and matted, or semi-erect pabencence.... . 3 .
3.5. Pubescence of thoras ahove and serond dorsal segment colored the same. . 36. Pubescence of head and thoras above grayish white, the thoras anteriorly and posteriorly with a black triangular patch of hack pubescence; secobd dorsal with scarlet pubescence; the erect pubescence of upper portion of insect black, otherwise inclusive of legs, whitish: apical serments, with pale pubseence, except the apex of second dorsal and the third (except at sides of botb), which have black pubescence.

Dugesii Ckll, and ('as.
36. Second dorsal with hack pubescence at base and apex in middle. ..... 37.
Second dorsal, at well as entire insect above, covered with a golden orangepubescence, with practically no erect hairs; puhescence of legs andbody beneath black....................................ealifornical var-
37. Second ventral segment with very coarse, scabrous sculpture, ground color black (body elothed throughont with whitish or yellowish white pubescevce)..................................................scabra Fox.
Second ventral segment with large, sparse, shallow pmetures, ground colorredlish (pubescence above varying from scarlet, to orange, to sellowishwhite, beneath it is always whitish)
38. Ground color reddish; second dorsal almost nude, with large, sparse punc- tures ..... 39.
Ground color black ..... 40.
39. Pubescence of head and thorax dirty white ; a black patch on third dorsal,the remaining segments with dirty white pubescence. .plionixn.sp.Pubescence pale yellowish throughout; no black patch on abdomen.venifica Blake.

ansior Blake.
23. Head and thorax rather densely clothed with grayish puhescence ..... 24.
Head and thorax not densely clothed with grayish pubescence. ..... 26.
24. First abdominal segment strongly nodose ..... 25.First abdominal segment hardly nodose, shorter and broader (ventrals 2 and3 fringed with pale pubescence at apex)..........nnonticola Cress.
2.) First abdominal segment nearly twice as long as broad, very much nodose : segments 3,4 and 7 with pale pubescence.........apicalata Blake. First ahdominal segment shorter and broader, not nearly as nodose; abdomen with long black hairs, except on the apical segment.
obscura Blake. var.
26. Apical margin of the segments, at least domally, with black puhescence, that of segments 1 and 2 grayish, or varying to blatek....obscura Blake. Apieal margin of the segments with pale pubescence, both above and beneath: pubescence of head and thorax mixed gray and black, the latter predominating, that of abdominal segments 1 and 2 black.

## Snoworinll Ckll. and Fox.

27. Head as usual, not as wide as thorax. 28.

Head large, fully as wide as thoms; head, thorax and abdomen from apical portion of segment 2 with pale yellow or fulvous brown pubesence.
annreolia Cress.
28. Head, thorax and abdomen above with fuivous or reddish pubescence.... 29.

Head and thorax with black pubescence above, the abdomen above from apical half of segment $\gtrsim$ with reddish pubescence, the ground color black
gorgon Blake.
29. Abdomen, except pubescence, entirely or in greater part black... ........ 30 .

Ahdomen, except segment 1, reddish, with pubescence of the same color: carina of first ventral segment prominently produced anteriorly . Foxi Ckll.
30. Pubescence of head, thomax ahdomen above, from apical half of second segment, fulvous; the gromed color beneath this pubescence apparently hlack
filvolirta Cress.
Pubescence of head, thorax and abdomen above, from apical half of second segment, carmine; the gromnd color beneath this pubesence reddish.
'Townsendi Ckll.
30. Mutilla glorionat Sauss.

Mutilln gloriosm Saussure, Am. Suc. Ent. France, vii, 359, pl. 8, fig. 9. \&, 1867.

Spherophthalmu tecta Blake, ibid, xiii, 216, \&, 18 si6.
Spherophthalma gloriosa Camerom, Biol. Centr. Amer. Hym., ii, 359, 1594.
California and Lower Califormia. Cresson's Mutilla tecta is apparently based on an alcoholic specimen of gloriosa, which, in fact of the immersion of the specimen, has the pubescence discolored. The ground color of the type specimen of tecta is not fuscous as described, but ferruginous.
31. Mutilla pseudopappus Ckll.

Spherophthalma gloriosa Siussure, var. pseudopappus Cockerell, Psyche, vii, Suppl., p. 6, 18ч5, ㅇ.
New Mexico: Las Cruces \{September〉; Arizona. I am inclined to regard this dark-bodied form as specifically distinct from the redbodied gloriosu; the latter seems restricted to the coast, whereas psendopappus is an inland species. The sculpture of the pygidium also differs in the two species.
32. Murilla magnat Cress.

Wutilla magne Cresson, Proc. Ent. Soc. Phila., iv, 355, q, 1865,
Sphrophthelma magna Blake, Tr. Am. Eut. Soc., xiii, 21t, S $^{2} 1886$.
Lower Californa; California eastward to Texas and Kiansas. The species is subject to much variation in size.
33. Mutilla \$ackenii ('ress.

Mutilla Sackenii Cresson, Proc. Ent. Soc. Phila., iv, 385, ㅇ, 1865.
Mutilla erudita Cresson. Tr. Am. Ent. Soc., v, 120, ¢, 1575.
Sphæroplthalma Sackenii Blake, ihid, xiii, 213, 乌 §. 1086.
Spherophthulmu erudita Blake, ibid, xiii, 217, ¢, 1886.
Arizona; Nevada; California; Lower Califormia. M. erudita Cresson is apparently not distinct from Sackenii. This is not gloriose Saussure as suggested by Dalla 'Torre in his catalogue.
34. Mutilla occislentalis Limné.

Mutilla occidentalis Linné, Syst. Nat., erl. 10, i, 582, 1758, $I_{\text {. }}$
Mutillu bifusciutn Swederus, Sveuska Vet.-Akad. Handlingar, viii, 285, \}, 1757.
Mutilla coccinea Fahricius, Eut. Syst., ii, 366, 1793.
Spherophthalma occidentulis Blake, 1. c., 223, § \}, 1886.
Occurs from New Jersey to Florida. It varies considerably in size, females measuring from $16-27 \mathrm{~mm}$.
35. Mutilla comanche Blake.

Mutillu clotho Blake, ibid, iv, $72, \rho, 1872$.
Spherophthalmu comanche Blake, ibid, xiii, 211, ¢ \$, 1806.
sphacrophthulmu clotho Blake, ibid, siii, 212, Y, 15 sit

Florida; Texas; Colorado; Kansas. I am inclined to regard this as a variety or western race of occidentalis
36. Mutilla orcus Cress.

Mutille orcus. Cresson, Proc. Ent. Soc. Phila., iv, 42c, ¢ §, 1865.
Aphærophthalmu orcus Blake, 1. c., xiii, 209, ㅇ \}, 1886.
Texas westward to New Mexico and Arizona; Mexico: Chihuahua and Lower California.
37. Mutilla ledia Blake.

Mutilla lete Blake, Tr. Am. Ent. Soc., iv, 72, ¢, 1872.
Sphrerophthalmu leth Blake, ibid, xiii, 216, ¢. 1886.
Texas. The shape of the thorax does not seem to be at all constant in this species, approaching in some specimens very close to the hexagonal form of the next section.
38. Mutillar rensat Cress.

Mutilla creusa Cresson, Proc. Ent. Soc. Phila, iv, 431, Y, 1865.
Mutilla medea Cresson, ibid, iv, 432, 乌. 1865.
Mutille bellona Cresson, ibid, iv, 434, $\circ$, 1865.
Sphærophtlulma bellona Blake, Tr. Am. Ent. Soc., xiii. 221, 乌, 1886.
Sphærophthulme creusa Blake, ibid xiii, 223, ¢, 1856.
Sphærophthatma medea Blake, ibid, siii, 294, \&, 1886.
Coloradn; Texas: Dallas (Boll). Both medea and bellona are identical, except as to minor color differences, with creusa; a series will show the intergradation.
39. Mutilla regina Cress.

Mutille ægina Proc. Ent. Soc. Phila., iv. 435, §, 1865.
Sphærophthutma ægina Blake. Tr. Am. Ent. Soc., xiii, 221, Y, $18 \times 6$.
Occurs from Kansas: Wallace Co, 3000 feet (Snow) to Arizona. Some specimens have the pubescence pale ochraceous.
40. Mutillit elio Blake.

Mutilla clio Blake, Tr. Am. Ent. Soc., vii, 251, Y, 1879.
Spherophthalma clio Blake. ibid, xiii, 214. Y, 1886.
Vancouver. Only the unique type seen.
41. Matilla Sicheliana Sbuss.

Mutilli Sicheliant Saussure, Ann. Sor. Ent. France, 4e. Ser. vii, 360, pl. 8, f. 10, Q, 1567.
Sphreropothulmu Sicheliana Blake, Tr. Am. Ent. Soc., xiii, 217, q, 1886.
Mexico (Saussure) ; Arizona.
The following nine species have the horly sparsely pubescent, and, as a rule, reddish; the heal is narmwer than thorax:
42. Mutilla quadriguttata say.
? Mutillu vagans Fabricius, Ent. Syst. Suppl., 282, ¢, 1~95.
Mutilla qualriguttuta Say, West. Quart. Reporter, ii, 74. Y, 1823.
Mutilla electru Blake, Tr. Am. Ent. Soc., iv, 75, 9. 1872.
Sphærophthalma quadriguttutu Blake, ibid, xiii, 239. 乌, 1886.
Sphærophthalma electra Blake, ibid, xiii, 248, Y, 1886.
Sphærophthalma quadrigutta vilr. biguttata Cockerell, Ent. New, vi, 63. Y, 1895.
Texas; Kansas. The legs vary from red to black, and the abdomen has or has not the segments fringed with silvery pubescence. The second dorsal may have four, two or no pale spots, or these may be so indistinct as to be scarcely discernible. The series before me shows the intergradation very nicely.

The var. biguttata may be vaguns Fabricius.
43. Mutilla ferrugata Fabr.

Mutilla ferruguta Fabricius, Syst. Piez., 438, \&, 1504.
Spherophthalma ferrugat, Blake, Tr. Am. Eut. Soc., xiii. 239, \&, 1886.
Massachusetts; Pennsylrania; Illinois; Wisconsin. This species, although well marked in the shape of ventral carina of first segment, has been confused in collections with several species having a superficial resemblance, i.e., the color of the body. For instance, no less than four species were found under ferrugate in the collection of the Am. Entom. Society.
44. Mutilla vestar Cress.

Mutilla vestu Cresson, Proc. Ent. Soc. Phila., iv, 436, §. 1865.
Spherophthulma vesta Blake, Tr. Am. Eut. Soc., xiii, 240, ㅇ, 1886.
This species inhabits the region west and northwest of Texas and Kansas, as far as British Columbia. Specimens from the Eastern States differ only in being less pubescent. M. macra (=hispida) is perhaps the male of vesta.

## 45. Mutilla sappho n. sp.

¢.-Ferruginous, including legs, except tarsi, which are fuscous; secoud segment with or without two pale spots; head narrower than thorax, with distinct separated puuctures, postero-lateral angles rounded ; first joint of flagellum distinctly shorter than two following united ; thorax elongate, pyriform, reticulated above; carina of first ventral segment somewhat emarginate medially so that it presents a bidentate appearance; second dorsal with elongate punctures, having the appearance of heing striato-punctate, the second ventral with deeper, stronger punctures; segments $2-6$ fringed with pale pubescence ; prgidium black, coarsely striated longitucliually. Length $7-12 \mathrm{~mm}$.

Georgia; Flurida: Cippron, in March, Lake Worth (Mrs. Slosson). Eleven specimens. In the red legs and apical segments this species may be at once distinguished fiom fermuata, under which name it will, no doubt, be found in many collections.

## 46. Mutillat rugulosat n. sp.

f.-Ferrnginous, clothed with a sparse, erect, pale puhescence, the apical segment with dense, silvery pubescence; legs brownish: abdomen from apex of second segment black, the latter above with two pale rellow spots; head with confluent pumetures, the postero-lateral angles obtuse: first joint of flagellum not as long as two following united; thorax rugose, espectally posteriorly; sentellar scale rather prominent; carina of first segment indistinetly bidentate; second dorsal striato-punctate, but sparsely punctured ou the space occupied by the yellow spots; pygidium strongly striated longitudinally. Length 6 mm .

Three specimens. Not rare in Southern New Jersey in September.
47. Mutillat eypris Blake.

Mutillu (今̌herophthulmu) cypris Blake, Tr. Am. Ent. Sec., iii, 246, \$. 1871.
Mutilla (Spherophthalma) mututa Blake, ibid, 347, 9 , 1871.
Spherophthalma cypris Blake, ihid, xiii, 239, \&, 1886.
Sphærophthalma mutata Blake, ibid, 241, Y, 1886.
Occurs from New Jersey (August) to Florida; also in Illinois: Algonquin ( Nason), and Colomdo. The maculation of second dorsal is subject to variation, and the size varies from 614 mm . The postero lateral angles of the head are always tuberculate, or with a short carina, by which character the species may be at once distinguished.

## 48. Mutillat aguliceps n. sp.

ㅇ.-Ferruginous, with sparse, pale, erect hairs; abdomen from apex of segment 2 black, this segment above with two pale spots; first three joints of antenne red, remainder blackish; tarsi fuscous ; head seen from front triangular. squarely cut off behind, the postero-lateral angles acntely produced, punctuation strong and distinct ; thorax ovato-pyriform, contracted behind from middle ; first abdominal segment with a small tooth medially at sides, the ventral carina bidentate ; second segment with elongate punetmren; pygidium longitudinally striated. Length 8 mm .

Illinois: Algonquin (Nason), July 19th. One specimen. Quite distinct by shape of head.
49. Mitilla caneo Blake.

Mutilh ceneo Blake. Tr. Am. Ent. Soc., vii, 250, ¢, 1879.
Mutilla mixture Blake, ibid, 251, ¢, 1879.
Spherophthalma mixtura Blake, ibid, xiii. 234, Q, 1886.
Spherophthatma caneo Blake, ibid, xiii, 241, ¢, 1886.
Texas; Colorado; New Mexico: Las Cruces, September 16th (Cockerell). I can see no differences between caneo and mixtura, except as to the quantity of pubescence on thorax, which is variable.

## 50. Mutillat sparsat n. sp.

Q.-Ferruginous, elothed with a sparse, erect pubescence, and in addition, the head, thorax and second dorsal above is covered with a thin, appressed, golden pubescence; base and apex of second dorsal and the remaining segments blackish;
apical margins of the segments with silvery pubescence, that on second dorsal broken into three spots, that on dorsals $3-5$ sprealing over the entire seguents medialls; head subquadrate, abont as wide as thorax, coarsely and confluently punctored; postero-lateral angles rounded; first joint of flagellnm about as long as two following mited: thorix priform, covered above with large pmetures; first segment with large panctures, the carina bidentate; second dorsal segment with elongate punctures, those at base coarser and rounder ; pygidium longitudinally striated. Length 11 mm .

Colorado. One specimen. This species combines the characteristics of the preceding species, 4 -guttuta to caneo, and the following five species. The head is intermediate in size between the two aggregations of species mentioned, and in the pyriform thorax it agrees with scouvolu, etc.

The following five species have the head wider than thorax, the latter more exactly pyriform, and the first segment is more nodose than in ferrugata and its allies.
51. Mulilla Ulikei Cress.

Mutilla Ulkei Cresson, Proc. Ent. Soc. Phila., iv, 397. ㅇ, 1865.
Sphærophthulma Ulkei Blake, Tr. Am. Ent. Soc., siii. 238, \&, 1886.
Lower California: Cape San Lucas. This is a remarkable species and not closely related to any other boreal American Mutillu.
52. Matillat texana Blake.

Mutillu texana Blake, Tr. Am. Ent. Soc., vii, 250, ㅇ, 1879.
spherophthutmu texuna Blake, ibid, xiii, 212, ¢, 1886.

## Texas.

53. Matilla scaevolat blake.

Mutillu (Sphærophthalmu) scevolu Blake, Tr. Am. Ent. Soc., iii, 247, Q, 1871. Sphærophthulma scrovola Flake, ihid, xiii, 241, 千, 1886.

Texas: Fedor, September (Birkmann); Colorado; Kansis: Wallace County, 3000 feet (F. H. Snow).

## 54. Mutilla cariniceps n. sp.

ㅇ.-Ferruginons, sparsely ellothed with pale, erect hairs: second dorsal with two pale spots, fuscons or black at hase and apex, dorsals 4 and 5 covered with silvery pubescence, segments 3 and folkowing hack, second and third ventrals fringed with silvery pubescence: legs blackish or hrown ; head sulouad mate, wider than thorax, strongly and elosely punctured, the postero-lateral angles bearing a short carina rumbing inwardly; thorax pyriform, rugosely punctured, tending to reticulate posterioly ; carina of first ventral segment entire, trumate : second dorsal with elongate punctures, the secoma ventral with the punctures tolerably strong and widely separated ; prgidiom longitudinally striated. fengih 10 mm .

Masachusetts; New Jersey; Pennsylvania. This species will be found in several collections under securola; the latter has not, as yet, been fomm in the Eastern States.
55. Milillat Bollii n. sp.

O,-Ferruginous; abdomen from apex of second segment black; legs rufopiceous: dorsals 3-6 medially and at sides with silvery pubescence, a spot at apex of dorsal segment 2 in the middle and ventrals $2-4$ with a fringe, of similar pubescence; head subquadrate, wider than thorax, covered with strong, close punctures, postero-lateral angles rounded, unarmed; thorax broadly pyriform, tending somewhat to hexagonal, coarsely punctured and distinctly: ventral carina of first segment subemarginate; seeond dorsal coarsely and closely punctured, unicolorous, except apex; second ventral with large, separated punctures; pygidium coriaceous, with some punctures and strix. Lengtls 12 mm .

Texas: Dallas (Boll). One specimen. In the five preceding species we have the cmnecting links between the elongated thorax species and those in which the thorax is hexagonal. In Bollii the thorax is less pyriform than in scervola or cariniceps and tends to hexagonal, and the sculpture of the pygidimn is more like that of the aggregation of species with hexagonal thorax.

The following twenty-two species are known in the male sex only, and while it is certain that they belong to the occidentalis group, they camnot be placed systematically with any degree of certainty :
56. Mintilla coccineohirta Blake.

Mutilla (Sphærophthalma) coccineohirta Blake, 1. c., iii, 235. §, 1871.
Sphærophthalma coccineohirta Blake, ibid, xiii, 221, \}, 1886.
California. That which Blake has described, rather vaguely, as the female of this species seems to be californicus Rads., and belongs to another section of the group.

## 57. Mutilla testaceiventris n . sp.

§.-Black, slightly inclining to piceous in places; head and thorax as far as middle segment and abdomen above from middle of segment 2 with long scarlet pubescence; dorsals, from middle of segment 2 , with reddish gronnd color; ventrals $3-7$ testaceous, with reddish puhescence; pubescence of remainder of body black; reticulation of middle segment rather large and distinct ; carina of first segment strongly angulate medially, the segment tolerably nodose; wings fuscons, third submarginal indistinet, first and second transverso-cubital veins distinctly separated above. Length $8 \frac{1}{2} \mathrm{~mm}$.

California: Poway. Distiuct from coccineohirta in the shape of ventral carina of segment 1 (dentate in coccineohirta), ground color of abdomen from segment 2 and shape second submarginal cell.
58. Mutillit ulisulit Cress.

Mutilla ursula Cresson, Tr. Am. Ent. Soc., v, 120, \}, 1875.
Sphærophthalmu ursula Blake, ibid. xiii, 218, §, 1886.
Texas; Coloralo; New Mexico; Arizona; Utah. A specimen,
rather undersized, from British Columbia, sent by Mr. Wr. H. Harrington, has the fulvous pubescence of thorax thimed to such an extent that the fulvons color is barely visible to the naked eye.
59. Mutilla welhraceat Blake.

Mutilla ochracert Blake, Tr. Am. Ent. Soc., vii, 247, さ, 1879.
Spherophthalma ochracea Blake, ibid, xiii, 228, \}ै, 1856 (not $\uparrow$; see M. progne).
Kansas; Colorado; Nevada: California. That which Blake has described as the female of ochracea is not related to the male; it belongs in another section of the genus.
60. Mntilla bioculatal Cress.

Mutilla bioculata Cresson, Proc. Ent. Soc. Phila., iv, 431, §, 1865.
Mutilla bioculata Cresson, Wheeler's Surv. W. 100th Mer., Zool., 709. \&, 1875.
Sphærophthalmu bioculata Blake, 1. c., xiii, 224, \}, 1886.
Texas; Colorado; South Dakota: Pierre. Cresson has described the female of this species which sex I have not seen. It is said to have the head and thorax above and second dorsal segment with long yellowish-ferruginous pubescence, otherwise with black pubescence. Is 7 lines ( 14 mm .) in length, and was found in Nevada. It may be the same as creusa.

This is a variable species as to size, ranging from $12-25 \mathrm{~mm}$. in length.
61. Mitilla pyrrhus n. sp.
§.-Black, segment 2 above and beneath ferruginous, the second dorsal with two large, paler spots; head and thorax above as far as middle segment with fulvons pubescence, that on the apical half of second dorsal segment short and yellower, otherwise the pubescence is black thronghont the insect; reticulation of middle segment coarse and irregular; first segment tolerably nodose, with large separated pnuctures, the ventral carina somewhat produced at both ends so that it is bidentate; wings fuscons, with three distinet submarginal cells, the second nearly as long as the first and widely separated above. Length 14 mm .

Florida: Enterprise, May 11th. One specimen. In the color of segment 2, this species has a superficial resemblance to custor and fenestrutu.
62. Mutillat phaon n. sp.
§.-Black, with black pubescence, except ou abdomen from, and inclusive of, second dorsal to apex, ventrals 3-6 laterally with long, bright scarlet pubescence; first segment tolerably nodose, with coarse, confluent punctures, the ventral carima in the form of a blunt angle; punctures of second ventral segment sparse medially ; wings fuseons, third submarginal indistinet, the second smaller, thongh uearly as long as first; first and second transverso-cubital veins separated above by a distance less than that between the base of second submarginal cell and recurrent vein. Length 13 mm .

Arizona. One specimen.
63. IIntillat clifron Blake.

Mutillu chirom Blake, Tr. Am. Ent. Soc, iv, 72. §, $18 \% 2$.
Sphærophthalmu chiron Blake, ibid, xiii, $2: 20, ~ §, 1886$.
Texas. It is doubtful if the specimens I have referred to chiron really represent that species. These $I$ am inclinerl to regard as a variety of ursula, having the thoracic pubescence black. They agree with Blake's decription of chiron, except that no mention is made of the pale maculation of dorsal segment 2 , and the third submarginal is much less distinct than one would imagine that of chiron, julging from the description. The latter might also he applier to the $\delta$ zelayu. Unfortumately the types of chirom seem to be absent from the material on which Blake's work is based.
64. Mutillat zelaya blake.

Mutilla zelayu Blake, ibid, iii, 234, §, 1871.
spherophthutma zelaya Blake, ibid, xiii, 211, oै, 1886.
Texas; New Mexico: Albuquerque, August (Snow). The of may be described as follows:-Black throughout, with black pubescence, except on dorsals 2-5, which have long fulvous puhescence extending a little outo the ventral segments; head with strong punctures; thorax elongate, broadest anteriorly, scarcely pyriform, above coarsely reticnlate, more distinctly posteriorly; first segment above coarsely pitted, the ventral carina strongly bidendate in consequence of a deep mesial emargination. Length 10 mm .
65. Mutilla castor Blake.

Mutilh (Spherophthulma) castor Blake, ibid, jii, 237, §, 1871.
Sphærophthulma chstor Blake, ibid, xiii, 297, \}, 1886.
Occurs from Illinois to Texas and Oklahoma Territory. Also in Florida. The color of the first two segments varies from entirely red with paler spots on segment 2 to black, except the pale spots mentioned. This species will, no doubt, be found under the name fenestratr Lep. in some collections.
66. Mutilla Lepeletirrii Fox (n. n. for fenestrata Lep, non Klug/.

Mutilu fenestrata Lepeletier, de St. Fargean, Hym., iii, 627, J, 1845.
Mutilla (Sphrerophthalma) fenestrata Blake, 1. c., iii, 238, \}, 1871.
Spherophthulma fenestrate Blake, ibid, xiii, 298, \}, 1806.
Pemnsylvania (St. Fargeau); New Jersey: Ocean County (J. B. Smith). It is somewhat difficult to decide from St. Fargeau's description whether Blake's custor or the specimens before me are fenestrata. Fargean does not mention paler spots on second seg-
ment, which leads me to believe that I have judged correctly in placing the specimens before me as fenestrata, inasmuch as some specimens have no trace of pale spots on segment 2 .
67. Matilla agenor n . sp .
§.-Black, with black puhescence: second dorsal segment with a transverse, broad, reddish yellow fascia, not extending on base or apes; this light-colored portion of the segment with rellowish pubescence: second ventral entirely black; antenne about as long as head and thorax; first dorsal segment less nodose than in castor, rather broad, convex, with large, coarse punctures, the ventral carina a little prominent posteriorly ; second dorsal with distinet separated punctures, the second ventral with much larger punctures; wings fluseons, third submarginal cell indistinct, the first and second transverso-cubital veins separated above. Length 10 mm .

Illimois: Algonquin, August 14th (Nason); British Columbia. Two specimens. This is a smaller and comparatively stouter insect than Lepeletierii.
68. Mutillat matera Cress.

Mutilla mucra Cressom, Proc. Ent. Soc. Phila., iv, 429, §, 1^65.
Spherophthalma hispidh Blake, Tr. Am. Ent. Soc., xiii. 226. §, 1886.
Spherophthalma materu Blake, ibid, 230, \}, 1586.
New Jersey; Delaware; Illinois: Algonquin, July and August (Nason); Colorado; Montana. Blake's hispidu and mucra are inseparable.
69. Matilla admetus Blake.

Mutilla atmetus Blake, Tr. Am. Ent. Soc, iv, 74, §, 1872.
Sphærophthnlmu admetis Blake, ibid, xiii, 229, §, 1886.
Texas; Colorado; Montana. Varies from 7-13 mm. in length.
70. Mutilla olbsenra Blake.

Mutilla (Spheroph.) obscura Blake, Tr. Am. Ent. Soc., iii, 239. \}, 1871.
Sphærophthalmu obseara Blake, ibid, xiii, 231, \}, 1886.
Sphrophthelma mucer (macerata) Blake, ibid. 237, 286, §, 1586.
Spherophthelnue macera Dalle Torre, Catal, viii, 56, 1897.
Massachusetts (Blake) ; North Carolina; Texas ; Colorado. M. macer, which name was subsequently changed to macerata by its author, is identical with obscore. The size is variable fully as much as in admetis. The specimens of macer mentioned by Blake as having the pubescence entirely black are referable to admetus.
71. Mutilla apisalata Blake.

Mutilu (Sphtrooph.) apicalata Blake, Tr. Am. Ent. Soc., iji, 238, §, 1871.
Sphxrophthalmu upiculata Blake, ibid, xiii, 230, \}, 188\%.
Mexico; Texas.
72. Mutilla creon Blake.

Mutilla creon Blake, Tr. Am. Ent. Soc., iv, 73, $\widehat{\text {, }, 1872 .}$
Sphærophthelma creon Blake, ibid, xiii, 228, \}, 1886.
Texas.
73. Mutilla eximia Blake.

Mutilla eximia Blake, Tr. Am. Ent. Soc., xiii, 200, 今, 1886.
Arizona. This is a typical Spherophthalma, but was described by Blake as a true Mutillu.
74. Mutilla Showorum Ckll. and Fox.

Sphærophthalmu Snoworum Cockerell and Fox, Proc. Acad. Nat. Sci. Phila., 135 §, 1897.
New Mexico: Albuquerque (Suow).
75. Mutilla canellat Blake.

Mutilla (Sphæroph.) canella Btake, Tr. Am. Ent. Soc., iii, 239, §, 1871.
sphærophthalma canella Blake, ibid, xiii, 230, §, 1886.
Texas; New Jersey: Gloucester County, August 16th.
76. Mulilla gibbosat Say.

Mutilla gibbosa Say, Bost. Journ. Nat. Hist., j. 298, \}. 1836.
Sphærophthalma gibbosa Blake, Tr. Am. Ent. Soc., xiii, 231, §, 1886.
Occurs from Massachusetts to Texas and Illinois; Mexico.
77. Mutilla muonticola Uress.

Matilla monticola Cresson, Proc. Ent. Soc. Phila., jv, 430, §, 1865.
Sphærophthalmu monticola Blake, Tr. Am. Ent. Soc., xiii, 226, \}, 1886.
Colorado. The first segment in this species is scarcely as nodose as in the preceding species, and approaches the form of that of fulvohirta, townsendi, etc.

The next series of species has the head at most as wide as thorax.
78. Mutilla elytemmestra $n$. sp.

ㅇ.-Black, the head, thorax and abdomen above with long white hairs similar to that of gloriosa, ete.; pubescence of legs and first dorsal black; head as wide as thorax; thorax posteriorly with large, coarse punctures; ventral carina of first segment dentate or angulate medially; second ventral segment rugosely punctured, scabrous; pygidium finely rugose. Length 8 mm .

California: Poway. Three specimens. Differs from thetis by larger size, black body and black pubescence of legs.
79. Mutilla thetis Blake.

Spherophthalmu thetis Blake, Tr. Ain. Ent. Soc., xiii, 214, ¢, 1886.
Arizona. Only the unique type seen.
30. Mutilla heterochroa Ckll. and Cas.

Sphærophthalma heterochroa Cockerell and Casad, Ent. News, v, 298, ㅇ, 1894.
New Mexico: Mesilla and Las Cruces in August and September
(Cockerell) ; Arizona: Phænix (H. G. Griffith) ; California: Riverside (Wickham). The latter specimen is the larger and has the pubescence of upper part of hody quite pale in comparison to typical examples.

Mr. Cockerell has suggested the possibility of S. Foxii being the male of heterochroa.

## 81. Mintilla phoenix n. sp.

․-Ferruginous, sides of thorax fuscous; head and thorax above with coarse, dense, dirty-white pubescence, that on thorax posteriorly sparse and black; legs with pale pubescence; second segment apically, and the remaining segments with coarse, dirty-white pubescence; a patch of black hair on third dorsal; lead about as wide as thorax, the latter hexagonal, with coarse reticulations on upper part of posterior surface; second dorsal with large, separated punctures, nude, except for the hair on apex ; punctures of second ventral sparse, but much feebler than those of the dorsal surface; pygidium black, rugose. Length 7 mm .

Arizona: Phœuix (H. G. Griffith). Two specimens.
8\%. Mutilla scabra Fux.
Spherophthalma scaber Fox, Proc. Cal. Acad. (2), iv, 94, ¢, 1894.
Mutilla scabra Dalla Torre, Catal. Hym., viii, 84, $¢, 1897$.
Lower California.
83. Mntilla Dugesii_Ckll. and Cas.

Spherophthalma Dugesii Cockerell and Casad, Ent. News, v, 294, $\wp$.
Mexico: Guanajuato (Ckll. and Cas.); Texas: Big Springs (Wickham).
84. Mntilla progne n. sp.

Sphærophthalma ocracea Blake, Tr. Am. Ent. Soc., xiii, 228, ¢ (non \} ), 1886.
Y.-Black, head, thorax and abdomen above with tolerably loug, shaggy, nchraceous pubescence; other pubescence black; head about as wide as thorax, cribrose with coarse punctures; first joint of flagellum about as long as tiro fol. lowing united; thorax bexagoual, coarsely puuctured; ventral carina of first segment prominently arched medially; second ventral with large, seattered punctures, with a small promineuce medially near the base; pygidium finely rugose. Length $9-12 \mathrm{~mm}$.

Occurs from New Mexico to California. This species has been described as the female of ochrucer, which I do not believe it to be.
85. Mutilla venifica Blake.

Sphærophthulma venifica Blake, Tr. Am. Ent. Soc., xiii, 210, ㅇ, 1886.
California: Santa Barbara. Only the unique type seen. The pubescence is quite sparse, the specimen having a rubbed appearance.
86. Mitilla califormica Rad.

Mutilla californica Radoszkowski, Hor. Soc. Ent. Ross, i, 86, T. ii, f. 7, P, 1861. Sphærophthalmu californicu Blake, Tr. Am. Ent. Soc., xiii, 219, Y, 1886.
Kansas; Texas; Colorado; Dakota; Wyoming; New Mexico; Arizona: Californat; Hudson Bay Territory. Specimens are subject to some variation as to size and color of pubescence. Two from Arizona and Wyoming differ only in having pubescence closer, appressed and not rough and shaggy as in most specimens.

The following two species have the head very large, wider than thorax; the latter is shorter and more truly hexagonal than in californim, etc., and on the whole the form is broader; pygidium rugose or coriaceous.
87. Murilla pacifica Cress.

Mutilla pacifica Cresson, Tr. Am. Ent. Soc., v, 120, ¢, 1875.
Spherophthalma pacifica Blake, ibid, xiii, 217, \&, 1806.
Colorado and California ; Lower California. Varies considerably in size.
88. Mutilla alureola Cress.

Mutilla aureolu Cresson, Proc. Ent. Soc. Phila., jv, 386, ¢, 1865.
Spherophthalma parmosa Blake, Tr. Am. Soc.. siii, 210, \&, 1806.
Spherophthalmu aureola Blake, ibid, 215, ㅇ. 1886.
Fphxrophthalma mollissima Blake, ibid, 215, of $9,1886$.
Nevada; California. Blake's types of mollissima were said to have come from Colorado; at present they bear no locality label, and I am inclined to doubt if they came from Colorado. The color of the pubescence varies from pale yellow to a ochraceous.
M. gorgon has the pygidium longiturlinally striated, otherwise closely agreeing with pacifica and anreola.
89. Mutilla gorgon Blake.

Mutilln (Spherophthalmu) gorgon Blake, Tr. Am. Ent. Soc., iii, 233, ㅇ, 1871.
Mutilla tisiphone Blake, ibid, vii, 249, 甲, 1879.
Fphærophthulma gorgom 13lake, ibid, xiii, 210, ¢, 1506.
Spherophthulme tisiphone Blake, ibid.
Texas: Dallas (Boll); Arizona; New Mexico: Mesilla, June 11th (Cockerell): Albuquerque in August (Sinm). Blake's tisiphone is apparently a rubbed specimen with paler pubescence. Specimens vary from $11-17 \mathrm{~mm}$. in size. One Texan example, a female, has the reddish hairs covering the upper part of head and thorax as well as abdomen. The $\delta$ may be described as follows:
§.-Black, with hack puhescence, except on abdomen above from middle of second segment, and on ventrals 3 and following at sides, where it is reddish; head with distinct punctures, much narrower than thorax ; punctures of dorsulum coarser than those of head; middle segment covered with deep, but not vers large retioulations: calcaria black; first segment coarsely punctured, not very nodose, the sinus between it and segment 2 not deep, ventral carina acutely angular; second dorsal with punctures much finer and closer than on segment 1 , the second ventral with large, seattered punctures; wings fuliginous, second submarginal cell nearly triangular in consequence of the first and second trans-verso-cubital veins nearly uniting above. Length 14 mm .

## Group permsylvanicu.

Here we have a group of four species combining the characteristies of Spherophthulma and Photopsis. The eyes are irregularly rounded or reniform in male, variable in size, rounded in female. Ocelli variable in size, romuded, small in sceva and pennsylemica, more as in groups imperiulis and curipilis. Mandibles heavy and short in male, more or less concave on upper surface, as in groups imperialis and anthophore, presenting above a scooped-out appearance, in the female the mandible is much as in group occilentulis, with an intermal tooth hefore apex First segment of female not quite sessile with the second, but more so than in the preceding group, in the males more or loss nodose. Thorax of female elongato pyriform. Tibial spurs not serrated. Marginal cell of a shape between subtruncate and acuminate, two distinct submarginal cells, the third, if present, quite faint. No trace of a pygidium in female.

It is difficult to draw a line of demarkation between the males of ${ }^{*}$ this and the following group. The shape of the ocelli is, as a rule, different in the two, hut is hardly sufficiently constant to prove of much importance. The only available character between these groups, on which the separation of the two may be based, is the total absence of a prgidimm in the female of group pennsylvenica.

This group formed part of Blake's genus sphurophthalma.

## MALES.

jastorlin n. sp.
3. Abdomen from apex of segment 2 black, with black pubescence; ocelli small.

मennsylvanisal Lep.
Abdomen entirely castaneous, clothed with golden pubescence; ocelli rather large
auripilis Blake.

## FEMALES.

Entirely ferruginous; first and second segments banded with white pubescene, that of apical seguents fuscons.......................baliteola Blake. Head and thorax ferruginous; abdomen and legs black ; first segment not banded.
virguncula Blake.
90. Mutilla segeva blake.

Mntilla (Spherophthulina) scava Blake, Tr. An. Ent. Soc., iii, 232, \}, 1871.
Spherophthalmu screva Blake, ibid, xiii, 207, $\}, 1886$.
Pennsylvania: Philadelphia; Virginia; Texas.
91. Mutilla peunsylvanica Lep.

Mutille pennsylomica Lepeletier de St. Fargeau, Hym., iii, 628, \}, 1845.
Sphæropothulma pennsylvanicu Blake, Tr. Am. Ent. Soc., xiii, 208, §, 1886.
North Carolina; Florida; Texas. Recorded from Pennsylvania by Lep. de St. Fargeau.
92. Mutilla auripilis Blake.

Matillic (Spherophthalma) auripilis Blake, Tr. Am. Ent. Soc., iii, 233. \}.
Spherophthalma ueripilis Radoszkowski, Hor. Soc. Ent. Ross., xix, 32, T. 6, f. 47, 1885̄; Blake, Tr. Am. Ent. Soc., xiii, 208, \}ै, 1886.
Texas; Oklahoma Territory.
93. Mutilla jason n. sp.
§.-Castaneons, clothed thronghout with pale pubescence, that on last two segments somewhat darker; legs aud flagellum blackish; antennæ about as long as the head and that portion of thorax anterior to middle segment; wings subhyaline, darker apically; two submarginal cells, the third barely discernible; marginal cell acuminate. Length 11 mm .

Texas. One specimen belonging to the U. S. National Museum. Easily separated from its allies by pale wings and pubescence.
94. Mutilla balteola Blake.

Mutilla (Sphxrophthulmu) balteola Blake, Tr. Am. Ent. Soc., jii, 248, ¢, 1871.
Sphærophthalmu bultcola Blake, ibid, xiii, 24ㅇ, ㅇ, 1886.
Texas; Oklahoma Territory.
ழ5. Mutilla virguncula Blake.
Sphærophthalma virguncula Blake, Tr. Am. Ent Soc., xiii, 253, Y, 1886.
New Mexico. Only the unique type seen.

$$
\text { Group imperialis ( }=\text { Photopsis Blake pt.). }
$$

In the males the ocelli are large, prominent, more or less reniform, the eyes large, irregularly rounded, tending to subovate, and usually subemarginate anteriorly and posteriorly, finely facetterl ; in the female subovate, also facetted. Mandibles of male as in group pennsylvanicu, in the female straight, with a small tooth internally
before apex, altogether much as in group occidentulis. First abdominal segment in male more or less nodose, varying in length, with coarser punctures than the second, always considerably narrower ; in female it is always smaller than second, not uniting evenly with it. Tibial spurs slender, not serrated. Marginal cell lanceolate or subtruncate; two submarginals, with a very faint trace of a third in some species. Pygidium of female large, finely granulated.

The chief points of difference between the males of this and group anthophore lie in the sculpture and shape of first abdominal segments. Both sexes of no species have been observed, whereas in gromp anthophorie the sexes of at least one species have been correlated.

This group is the American representative of the Enropean Tricholabiodes Rad., differing in having no trace of a third submarginal cell.

## MALES.

First segment seen from the side distinctly nodose. . . . . . . . . . . . . . . . . . . . . . . . . 2. First segment scarcely nodose, gradually broadened from base to apex (head, thorax and first segment castaneous brown, segments 2 et seq. black; legs and antennee pallid).
nigriventris Fox.
2. Pubescence mure or less golden or yellowish...................................... . . 3.

Pubescence pale or subfuscous....................................................... . 4.
3. Pubescence on dorsuhum and abdominal segments 2 and following yellowish, otherwise pale fuscous; head and legs black; wings more or less fuscous on apical third.
imperialis Blake. Pubescence throughont yellowish: the insect entirely fulvous, sometimes becoming quite dark: wings dark fuscous thronghont.

Edlwirdsii Cress.
4. First segment forming a rather distinet node at apex.......................... 5 .

First segment more of a convex. rather than nodose, form at apex, or it may be described as slightly nodose................................. ....... . 10.
5. Abdomen more or less blackish or fuscous......................................... 6.

Abdomen not at all dark............................................................ . . . 8 .
6. Abdomen from base of segment 2 black; dorsulum not dark.................. 7 .

Abdomen from apex of segment 3, femora, tibie and dorsulum blackish; head not dark ; antenne and tarsi testaceons...........elara Cress.
7. Legs and antenne pale testaceous; first segment elongate, rather narrow.
mesillensis Ckh.
Legs and antennæ black; first segment broader........belleropholl n. sp.
8. Wings fuscous in greater part: pubescence subfuscous. . ferringinosa D. T.

Wings hyaline in greater part.
..................... 9.
9. Wings crossed by a fuscous cloud from the stigma, the latter dark. Length

Wings clear, with a yellowish caste; stigma pale. Length 15 mm .
heliraoll n. sp.
10. Abdomen castaneons brown, if at all darker the apical (4-7) may he fuscous. . 11. Abdomen black from and inclusive of segment $2 . . . .$.
11. Head considerahly prodnced and rapidly narrowed behind, somewhat rhomhiform, but romnded at the occiput: first abdominal segment banded with white pubescence at apex, segments $4-7$ fuscons.
alloicincia n. sp .
Head broadly rounded behind; first segment not banded with white, the apical segments castaneous brown. . .......................................... 12.
12. Insect thronghont very pale, especially legs and antenne. clothed throughout with a long, erect, whitish, rather dense pubescence; stigma pale.
territas Ckll.
Insect castaneous brown ; pubescence sparser and darker, thongh pale ; stigma dark . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 13.
13. Antenna much shorter than head and thorax united. .brevirornis n. sp. Antenma as long or nearly as long as head and thorax muited.............. 14 .
14. First segment about three times wider at apex that at hase, evenly convex, its punctuation separated
.nnelicansa Blake.
First segment abont two times wider at apex than at base, its purctuation confluent.
orestes n . sp.
15. First segment about three times wider at apex than at base, its punctuation separated; hearl concolorous with thorax; legs pale....plinton. sp. First segment elongate, subpetiolate, barely twice as wide at apex as at base, its pmetuation more or less confluent. . . . . . . . . . . . . . . . . . . . . . . . . . . 16.
16. Head transverse, broadly truncate behind, black; space between hind ocelli much greater than that hetween them and eyes; antenne shorter than head and thorax; legs dark.
nolionnis Blake. Head considerably produced and romnded behind, concolorous with thorax; space between hind ocelli slightly less than that between them and eyes; autennæ slender, about as long as head and thorax; legs pale.

Hubbatrain. sp.

## FEMALES.

Insect above, at least on head and thoras, clothed with a dense pubescence con-

Insect with a sparser pubescence. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .
2. Pubescence reddish or golden. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 3.

Pubescence of head, thorax and abdomen above from middle of second segment golden yellow; groand color dark, the anterior half of second dorsal segment with long black hairs................Inarpesia Blake.
3. Ahdominal segments 3-6 above and beneath more or less with pale pubescence. 4 . Abdominal segmeuts 3-6, as well as the entire upper surface of abdomen, with golden pubescence: ground color reddish, sides of thorax blark.
zenohian Blake
4. Pubescence of thorax above and second dorsal segment coppery red, the long, erect pubescence paler; head covered with au appressed, grarish pubescence, as well as erect hairs: ground color of ahdomen reddish, dorsals 3-5 fringed medially with yellowish pubescence.... arotat Cress.
Pubescente of thorax above and second dorsal, except laterally and posteriorly, fulvous; head anteriorly with grayish pubescence, above with fulvons; grouud color of abdomeu black, the fulvous pubescence of the second
dorsal not completely covering the segment, leaving a black space laterally and posteriorly ; segments $2-5$ fringed with white pubescence at apex...........................................................eres n. sp.
5. Insect rather densely clothed with a fine, silky, pale pubescence, especially the head and apical segments, that on head and thorax above short, dense and appressed, elsewhere long and paler, on abdomen from apex of segment 2 dense aud whiter: second dorsal covered with strong punctures, not coarse as in other species; pygidium finely rugose longitudinally : form rather broad. the thorax subquadrate. halleyone n. sp.
Insect less densely pubescent, in some species fairly well clothed, however; second dorsal with very strong punctures, or rugose; prgidium at most finely grannlated....................................................... . 6.
6. Sceond dorsal segment punctured throughout...................................... 8.

Second dorsal segment coarsely rugose toward the base (iusect reddish)..... .
7. Thorax pyriform. rugosely punctured ahove; second dorsal hasally with strong,

Thorax short. subquadrate, coarsely rugose above: second dorsal basally coarsely sculptured, covered with rough tubercles or projections, apically rugoso-punctate.................................... dirce n. sp.
8. Head eutirely and thorax more or less covered with a close, appressed pubescence, the entire body clothed with an erect, whitish pubescence, es pecially dense on abdomen, basally and apically and sides of thorax ...9.
Head and thorax bare or sparsely pubescent.................................... 10.
9. Body pale ferruginous, legs prale; dorsals 3 and 4 with a patch of black-brown pubescence, strongly contrasting with the pale pubescence, with which it is surrounded
diomeda n. sp.
Body dark ferruginons, including legs ; apical dorsal segment with sparse, pale pubescence.............................................erato Blake.
10. Second dorsal with elongate, more or less confluent punctures............... 11 .

Second dorsal with separated punctures (thorax rogose above, truncate behiud)... ........................... . . ................natninlat D. T.
11. Head with strong, distinct punctures; thorax rugoso-punctate; legs blackish...................................................alloopilosat Blake.
Head finely rugose; thorax above rugose; legs red ; exes unusually convex.

The six following species have the first segment strongly nodose, much as in the occidentalis group:
96. Mutilia innperialis Blake.

Aguma imperiulis Blake, Tr. Am. Ent. Soc., iii, 260, §, 1871.
Photopsis imperiulis Blake, ibid, xiii, 265, \}, 1586.
Texas.
97. Mutillai Edwardsii Cress.

Mutilla Edwardsii Cressou, Tr. Am. Ent. Soc., v. 119, §, 1575.
Spherophthedma Ellecerdsii Blake, ibid, xiii, 208, ई, $18 \times 6$.
Oregon; Washington; California.
Imperialis and Educurdsii have the appearance of the males of
group occidentalis ( $=$ Spherophthalma) ; but while the next four species agree with them in shape of first segment, they are more of the type of group anthophorce, which I regard as typical Photopsis.
98. Mutilla clara Cress.

Mutilla clara Cresson, Proc. Ent. Soc. Phila., iv, 439, \}, 1865.
Agama clura Blake, Tr. Am. Ent. Soc., iii, 261, §, 1871.
Photopsis clara Blake, ilid, xiii, 262, §, 1886 .
Colorado. Only the unique type seen. The fore wings have a small, pale, fuscous spot near posterior margin medially.
99. Mutilla danaus Blake.

Agana danauv Blake, Tr. Am, Ent. Soc.. iii, 261, §. 1871.
Photopsis dunuus Blake, ibid, xiii. 261, $\mathcal{\delta}, 1886$.
Texas. Easily recognized from other species of this group by fasciate wings and strongly nodose first segment.

## 100. Mintilla bellerophon n. sp.

§.-Head, thorax and first segment castameons; head sometimes in part, legs and abdomen, from and including segment \&, black; antennæ as long or longer than head and thorax, flagellum fuscous; head with strong, separated punctures, broadly ronnded behind; space between hind ocelli distinctly less than that between them and eyes; first abdominal segment distinctly nodose, coarsely punctured, considerably widened apically; second dorsal with seattered panctures, closer basally; dorsals 3-6 finely and closely punctured; second ventral with large, separated, even punctures; wings sublyaline, stigma black, nervnres testaceous; entire insect clothed with an erect, pale pubescence. Length $6 \frac{1}{2} \mathrm{~mm}$.

Arizona; New Mexico: Santa Fé in July (Cockerell). Two specimens.

## 101. Mitilla mesillensis Ckll.

Photopsis mesillensis Cockerell, Entomologist, $\mathrm{x} \times \mathrm{x}, 137$, $\widehat{\text {. }}$
New Mexico: Mesilla, July 30th. Mr. Cockerell kindly loaned me the type of this species.
102. Mutilla helifation sp.
§.-Entirely pale castaneous; legs and flagellum more testaceous; head with strong, separated punctures, ratber well produced and narrowed behind eyes, hind margin subrounded ; antennæ shorter than bead and thorax: space between hind ocelli, if anything, slightly greater than that between them and eyes: punctures of dorsulum large and separated; first ahdominal segment rather short, nodlose, coarsely punctured, in length shorter than middle segment; second and following dorsals sparsely punctured, the second ventral more strongly; wings subhyaline, slightly yellowish, nervures and stigma pale, recurrent vein received by second submarginal cell between base and middle; entire insect clothed with an erect, pale pubescence. Length 15 mm .

Nevada. One example.

## 103. Matillat albicincta m. sp.

\}.-Pale castaneons, abdominal segments 3 and following fuscous; ocellar region black; head considerably narrowed and produced behind eyes, so that when viewed from above it has a somewhat triangular form, punctures not strong, scattered ; antennæ nearly as long as head and thorax; space between hind ocelli a little greater than that between them and eyes; mesoplenre with an irregularly oblique ridge from base of wings downward; first abdominal segment with coarse, scarcely confluent punctures, nodose, but not strongly, heing rather more of a strongly convex form at apex, longer and narrower than in helicaon, hut still not as long as middle segment; punctures of rest of abdomen sparse and not very strong, those on second ventral strongest; wings subhyaline, not jellowish, stigma dark, nervures pale; entire insect elothed with erect, white pubescenee, and apex of segments $1-6$ with a fringe of white pulescence. Leugth 11 mm .

## Arizona. One example.

## 104. Mutillat brevicornis n. sp.

\}.-Castaneous; apical segments but little, if anything, darker: legs and antenne testaceous; head with separated punctures, rather square when viewed from above in consequence of not contracting very much behind eyes, posterior margin rather evenly ronnded; space between hind ocelli less than that between them and eyes; antenne short, about equal to length of head and that portion of thorax anterior to middle segment; dorsulum with large, separated punctures; mesopleure not ridged ; first abdominal segment with large, well-separated punctures, rather broad and strongly convex, rather than nodose at apex; second segment above sparsely, beneath strongly punctured, remaining segments finely and closely ; wings subhyaline, nervures pale, stigma darker; entire insect with ereet, pale (not white) pubescesce, apex of second or second and third segments with a fringe of white pubescence. Length 11 mm .

Texas; Montana. Has been confused with melicausa by writers.

## 105. Mutilla melicansat Blake.

Agama melicause Blake, Tr. Am. Ent. Soc., iii, 240, \}, $18 \% 1$. Photopsis melicansa Blake, ibid, xiii, 262, §., 1886.

## Texas.

106. Mutillat territa Ckll.

Photopsis territus Cockerell, Ent. News, v, 200, §, 1894.
New Mexico: Las Cruces. The head seems to be almost impunctate in this species.
107. Mutilla pluto n. sp.
§.-Head, thorax and first abdominal segment castaneous, remainder of abdomen fuscons or hlack, with segments margined with testaceous at apex ; antemnæ and legs paler than thorax; head rather well prodnced behind eyes, not much contracted, subronnded, punctures strong and separated; space between hind ocelli distinctly less than that between them and eyes; antenne shorter than head and thorax, its length somewhat greater than the head and that portion of thorax anterior to middle segment; first abdominal segment broad, widened at least three times apically, strongly convex, the punctures confluent basally, distinct toward apex; secoud segment above shining, sparsely punctured, except
laterally, beneath with strong, seattered punctures; remaining segments finely and elosely punctured; wings subhyaline, slightly yellowish, nervures and tigma pale; entire inscet clothed with pale puhescelce, a whitish fringe at apex of second or second and third segments. Length $11-12 \mathrm{~mm}$.

Texas. Five specimens. This species has been confused with nokomis, but is quite distinct by shape of first abdominal segment.
108. Mulilla mokomis Blake.

Agam" nokomis Blake, Tr. Am. Ent. Soc., iii, 260, \}, 1871.
Photopsis nokomis Blake, ibid, xiii, 259, §, 1856.
Arizona. Only the unique type seen.
109. Mutilla Mublbardia n. sp.
\}.-Head, thorax and first abdominal segment eastaneons; abdomen black from segment 2 ; legs and antenme testaceons, the flagellum and hind legs pertaining to fuscous; pubescence whitish ; head considerably produced and rounded behind eyes: space between hind ocelli slightls less, if anșthing, than that between them and eyes; antennæ ahont as long as head and thorax united; first abdominal segment elongate, subpetiolate, nodose, but not strongly at apex, its punctures large and somewhat confluent ; sccond dorsal with large, sparse punctures laterally, those of the second ventral larger and more abundant; wings subhyaline, nervures testaceous, stigma dark; second submarginal cell shorter than first, the second transverso-eubital vein straight. Length $8-10 \mathrm{~mm}$.

Arizona: Chiric Mts. and Fort Grant in August (H. G. Hubbard). Two specimens in collection U. S. National Museum.

## 110. Minilla orestes n. sp.

を.-Pale castaneons; legs and antemme paler, clothed with a rather sparse, pale pubescence throughomt, the abdominal segments $2-5$ with a short, whitish fringe; head subquadrate, considerably produced, but searcely narrowed behind eres. almost truneate hehind, punctures tolembly strong and separated ; space between hind ocelli very slightly less than that between them and eves: antennæ fully as long as head and thorax umited: first abdominal segment rather narrow, not more than twice wider at apex than at base, convex or subnodose at apex ; punctures eoarse and confluent ; second dorsal sining, sparsely punetured, the ventral moiety more distinctly; wings subbyaline, somewhat yellowish, stigma dark, nervures pale. Length 14 mm .

One specimen with no locality label. Inhabits the Southwestern Uniter States, probably.
111. Mutilla ferriginosa D. T.

Aguma ferriginea Blake (nec Smith), Tr. Am. Ent. Soc., vii, 25ı. §. 1879.
Photopsis ferruginea Blake, ibid, siii, 264, \}, 1 se6.
Mutillu ferruginosa Dalla Torre, Cat. Hym., viii, 40, 1897.
Nevada.
112. Mutilla nigriventris Fox.

Ihotopsis nigriventris Fox, Pr. Cal. Ac. Sci. (2), iv, 5, \}, 1893.
Lower Califormia. The first segment in this species is only gently
convex, and approaches in shape that of the males of the next group; the segment is strongly punctured, however, and for that reason I have placed the species in group imperialis.

The following thirteen species are no doubt the femates of some of the species just cuumerated under group imperialis:
113. Milillan arotat Cress.

Mutilla crota Cresson, Tr. Am. Ent. Suc., v, 120, ㅇ, 1575.
sphærophthelmu arota Blake, ibid, xiii, 218, $\uparrow, 1886$.
California: San Diego. Only the unique type seen.

## 114. Mintilla ceres n. sp.

Q.-Ground color: head and thorax ferruginous: abdomen and legs back; head, except vertex. covered with close, appressed, grayish pubescence; vertex. thorax and second dorsal, except at sides and apex, with fulvous pubescence; segments $2-5$ with a fringe of white pubescence; remainder of insect with erect, pale pubescence, that on tarsi somewhat golden; punetures of second abdominal segment above and beneath very large and separated; pygidium finely granulated, delicately margined laterally. Length 8 mm .

Arizona. One specimen.

## 115. Mutilla zenobiat Blake.

Mutillu zenobia Blake, Tr. Am. Ent. Soc., vii, 250, ㅇ, 1879.
Spherophthulmu zenobia Blake, ibid, siii, z20, 乌, 1856.

## Califormia.

116. Mintillat marpesia Blake.

Mutilla murpesia Blake, Tr. Am. Ent. Soc., vii, 246, P, 1879.
Spherophthutme murpesin Blake, ibid, xiii, 218, \&, 1506.
Spharophthalmu luteoln Blake, ibid, xiii, 235̄, 马, 1886.
Kansas (Suow) ; Utah. Only the two original types seen. It seems that murpesin and luteola were deseribed from the same specimens.

## 117. Mitilla lialeyone n. sp.

f.-Entirely ferruginous. clothed with pale hair, that on head and thorax above close and appressed, on the abdomen from apex of segment 2 dense and whiter, else where longer and erect. the first segment with a white hand at apex: legs rather rohust : thorax short, subyuadrate; sides with few punctures; second dorsal segment with strong punctures, which appear more or less confluent in consequence of a thin, appressed pubescence, with which the segment is covered; second rentral with stronger punctures; pgidium finely rugose longitudinally. Length 9 mm .

One specimen without precise locality. Oecurs probably in the Southwesteria United States; very likely in Texas.

## 118. Mutillat diontedat m. sp.

f.-Entirely ferrnginous, clothed with pale pubescence, that on head and pos-

[^1]terior half of thorax close and appressed, segments $2-5$ fringed with white pubescence, except dorsals $3-5$, which are clothed medially with black-brown pubescence, elsewhere the pubescence erect; first segment not banded with white; antennæ thick, first and second joints of flagellum about equal in length; thorax elongate, somewhat pyriform; legs robust; second dorsal covered with strong, separated ponctures, those of second ventral stronger; pygidiom apparently striated longitudinally. Length 7 mm .

Texas. One specimen.
119. Mitillit erato lslake.

Mutilla erato Blake, Tr. Am. Ent. Soe., vii, 251, $\mathcal{F}, 1 \times 79$.
Aphærophthalma eruto Blake, ibid, xii, 213, q, 1086.
Texas. Only the original type specimens seen.
120. Mulilla albopilosat Blake.

Mutille ulbipilost lBake, Tr. Am. Ent. Soc., iv, 74. Y, 1872.
Spherophthalmu albipilosu Blake, ibsil, 241, ¢, 1886.
Texas.
121. Mitillat Iatodaniat n. sp.
Q.-Ferruginons, clothed with a thin. rather short. pale pubescence, that on thorax ahove pertaning to rellow; segments $2-5$ fringed with whitish pubessence: head with coarse, confluent punctures; first joint of flagellum distinetly longer than second; thorax elongate, pyriform, rugosely punctured above, sides with large punctures; legs comparatively slender; second dorsal segment with large, separated punctures, and at base with coarse, longitudinal ruge or folds ; second ventral with large punctures, the basal median carina strong ; third segment strongly panctured, the others rather finely aur closely; pygidium finely gramulated, not margined. Length 11 mim.

## Arizona. One specimen.

## 10\%. Mutillat direce n. sp.

Q.-Ferrnginons, legs and antennæ rather testaceons; pubescence pale and erect, abdominal segments $2-5$ fringed with whitish; head rugoso-punctate, with a thin, appressed pubescence ; first joint of flagellum a little shorter than second; thorax short, subtruncate behind, sides rounded, its upper surface covered with rongh projections or tubercles; second dorsal segment basally toughened like the thorax, on apieal half strongly punctured; second ventral with coarse, irregular punctures, those on remaining segments finer; pygidium fincly margined, obtuse at apex, finely grannlated. Length 7 mm .

Arizona: Tucson (Wickham). One specimen.

## 123. Mutilla myirliat n. sp.

O.-Ferruginous, second dorsal apically rellowish; pubescence seant; head finely rugoso-punctate; eyes prominent, unusually convex; first joint of flagellum longer than second; thorax pyriform, rugose above, especially posteriorly, where there are several coarse, transverse folds: second dorsal covered with strong, elongate, more or less confluent punctures, those on second ventral more separated; pygidium margined, subacute at apex, sculpture indistinct, apparently finely striated longitndinally. Length 6 mm .

Colorado: Fort Collins (Gillette). This species bears a close resemblance to $\mathrm{M}_{\text {. caneo Blake. }}$
124. Mutilla manula D. T.

Mutilhe pygmza Blake, Tr. Am. Ent. Soc, vii, 250. , 1579 (nec Gerstaecker), Sphærophthulmu pygmæa Blake, ibid, xiii, 253, , 1886.
Mutilla munula Dalla Torre, Cat. Hym., vii, 65,1s97.
Texas; Nevada; Colorado. I have only seen specimens from the latter region.

Group anthophore.
Very similar to group imperialis, but with the first and second ablominal segments of female uniting evenly, sessile, the male having the first segment not nodose, but convex, and not more coarsely puactured than the second.

This group, formed part of Blake's genus Photopsis (=Ayumu Blake), and seems to be the American representative of the European subgenus Pseudophotopsis André, from which it differs by the unarmed postscutellum. The species known in the female sex, when hitherto described, have been in nearly every case referred to Spherophthulmu; this has also been the case with the females of group imperialis.

## MALES.

First abdominal segment rather suddenls and distinctly narrowed anterior to its stigma, the punctuation of the second dorsal, as a rule, becoming sparser medially

$$
\text { . } 2 .
$$

First abdominal segment not distinctly contracted anterior to its stigma, but rather evenly narrowed its entire length, the pmatnation of second dorsal rather even throughout.

$$
\text { . } 18 .
$$18.

2. First ahdominal segment rather narrow and elongate, contracting rather sharply on basal half, its apical width considerably less than that of the second segment, so that the latter is rather sharply contracted to meet it.
First abdominal segment shorter and broader, not contracting very much on hasal half, its apical width greater, more nearly sessile with second. . 10.
3. Wings subhyaline, at the most slightly tinged with yellow.................... 4 .

Wings subfuscous, pubescence of abdomen rellowish........................ . 9.
4. Head not much narrowed behind eyes, at least not enougb to make it tringnlar from above. .5.
Head considerably narrowed and produced behind eyes, apparently triangular when viewed from above; space between hind orelli greater than that between them and eyes; "wings yellowish-hyaline."
triangularis Blake.
5. Apical abdominal segments more or less fuscons.................................... . Apical segments concolurous with remainder of abdomen, bale castaneons: first and second dorsal segments almost impunctate or nearly so....6.
6. Rather densely pubeseent; legs and antenne pale; space between hind ocelliless than that between them and eyes. Length $14 \mathrm{~mm} . . . c e y \mathbf{x} \mathrm{n} . \mathrm{sp}$.
Pubeseenee thin; legs and autennae testaceous-brown; space between bindocelli a little greater than that between them and eyes. Length $9-10$
mm. sinphion $11 . s p$.
7. Antenna and legs pale: first and second dorsal segments impunctate; spacebetween hind ocelli less than that between them and eyes............ S.
Antenne and legs more or less fuseous; first and second dorsal segments punc-tured, the latter very sparsely; space between hind ocelli about equalto that between them and eves. . . . . . . . . . . . . . . . . .concolor Cress.
8. Head distinetly marrowed behind eses: wings not yellowish. Length 10 mm .
colorarlensis $D . T$.
Head broad, not narmow behind eyes; wings tinged with yellow. Length 
9. No black marking in the thoracic sutures, or about the eoxæ. Length

Sutures of thorax, especially between scntellum and middle segment and about the eoxae. black. Length $12 \mathrm{~mm} . . .$. .eoniralienda? var'?
10. Wings subhyaline, at most faintly yellow. . . . . . . . . . . . . . . . . . . . . . . . . . . . . 11.
Wings more or less subfuseous, or yellow, or rellowish with subfuscous elouding . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 14.
11. Head broad, searcely narrowed behind eyes; legs and antemnre testaceo-fus- eous. apical segments usually fuscous. . . . . . . . . . . . . . . . . . . . inro Blake.
Head narrowed behind eres; legs and antema pale. ..... 12.

13. Space between hind ocelli distinetly greater than that between them andeyes; that portion of head behind the latter somewhat semielliptic inshape. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . juxisi Blake.
Space between hind ocelli slightly less than that between them and eyes;head rather square behind eyes. . . . . . . . . . . . . . . . . . . . . infirlix D. T.
14. Body more or less blaekish ..... 16.
Body pale castaneous. ..... 15.
15. Wings with a jellowish tinge, faintly margined with fuseous, a dark roundedeloud in middle of posterior margin of anteriors: pubescence pale;
Wings broadly and distinctly margined with fuseous; pubeseence yellowish;head square behind. . . . . . . . . . . . . . . . . . . . . . . . . . . . ninicolor Cress.
16. Entirely black-brown; wings yellow ..... menaliea Blake.Not entirely dark, the black confined to thorax on sides and beneath, legsand first segment.17.
17. Head, thorax and abdomen elothed with a reddish pubescence; abdomen entirely eastaneons; scape and pedicel testaceous: flagellnm black; wings broally margined with fuscous. . . . . . anillophorae Ashm
Head, thorax and abdomen with a pale yellowish pubescence; first segment black; antennæ eoneolorous throughout, testaceous-fuscous: "wings yellowish byaline, clonded about the middle and apex."
rasticai Blake.
18. Iast dorsal segment distinetly margined laterally ..... 19.
Last dorsal segment smooth, not earinate or margined ..... 20.
19. Head large, broad, squarels and considerably produced behind eyes; spacebetween hind ocelli equal to but little more than half that betweenthem and eyes; first dorsal segment not banded with white puhes-cence; legs testaceous...........................preriosissiman D. T.
Head ordinary rounded behind; space hetween hind ocelli abont equal tothat between them and eyes; first dorsal segment banded at apex withwhite pubescence; legs dark.adollis n . sp .
20. First abdominal segment distinctly longer than it is broad at apex, not alto-gether sessile with the second.21.
First abdominal segment shorter and broader, its length nearly equalled by its width at apex, nearly sessile with second ..... 27.
21. Secoud dorsal segment distinctly punctured throughont ..... 22.
Second dorsal segment sparsely or not punctured medialls. ..... 24.
22. Ventral carina of first segment even, not prominent posteriorls ..... 23.
Ventral carina of first segment prominent or produced posteriorly, so that itis bisinuons, or bidentate.pallida Blake.
23. Space between hind ocelli slightly less than that between them and eyes; first segment rather strongly and evenly punctnred; legs dark.
tapajos Blake.
Space between hind ocelli distinct less than that between them and eyes;first segment sparsely punctured apically ; legs testaceons.
anlins Blake.
24. Insect testaceous brown, venation dark, at least the stigma ..... 25.
Insect pale yellow, venation very pale, so as to he almost indistinct ..... 26.
25. Legs rather dark: thorax castaneons; abdomen from second segment black-ish; first segment rather strongls convex at apex. Madejisiii D. T.Legs pale; head and thorax of a paler color than abdomen, but the latter isnot blackish; first segment scarcely couvex at apex..alemon n. sp.
26. Lengti $6-7 \mathrm{~mm}$.; middle segment reticulated ; form elongate.arcondias m. sp .
Length abont 3 mm .; middle segment not reticulated ; form shorter.
Ashmeadii Fox.
27. Insert castaneous. ..... 28.
Insect black; wings pale fusco-hraline fhamyras n. sp.
28. Wings subhraline, not fuscous; head rather finely punctured : legs concolor-ous with body.hy:alina Blake.
Wings crossed by a fuscous cloud beyond stigma; head strongly punctured; legs dark sarpedon n . sp .
FEMALES.
Insect more or less clothed with a dense, appressed pubescence, in addition to the longer, erect liairs ..... 2.
Insect without appressed pubescence, with erect hairs only ..... 6.
2. Secoud dorsal with appressed pubescence, which is quite long thronghout:first joint of flagellum nearly as long as two following joints, pedicelshort3.Second dorsal with erect hairs only, the head and thorax with short, appressedpubescence, that on apical segments longer, ferruginous; first joint offlagellon but littie longer than the second, the pedicel elongate,equalling it in lengthhypermmestran. sp.
3. Pubescence scarlet, grading into fulvous in some specimens (ground color black)
antlioplıore Ashm.
Pubesceuce pale golden.
.4.
4. Greater part of body (silles of thorax, abdonen, legs) black; thorax tolerably elongate and pyriform ; pubescence rather coarse. Length 12 mm .
anrairial Blake.
Greater part of body reddish: thorax shorter, more quadrate; pubescenee silky. Length nuder 7 mm . .5.
5. Thorax anteriorly a little wider than head, rather short; ground color fnseoferruginous. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . aspasisi Blake.
Thorax anteriorly, if anything, narrower than head, rather elongate; ground color pale ferruginous. . . . . . . . . . . . . . . . . . . . . . . . . . . phatirat Blake.
6. Thorax short, truncate behind, its upper surface not much longer than wide. 7 . Thosax elongate.
. 8.
7. Thorax abuve rugoso-punctate, the punctures of secoud dorsal segment at base strong, apically becoming weak and sparse; a band of white pulsescence at apex of segments $1-4$ : color deep ferruginous.exigone n. sp.
Thorax with tolerably strong, separated punctures, the second dorsal similarly punctured, the punctures even thronghont; no white bands on abdomen, but a sparse, silvery pubescence on second dorsal; color pale, ferruginous. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .ilione n. sp.
8. Thorax oblong, truncate aud but little narrowed behind (ferrnginous, legs testaceous, apieal segments fuscous; pubescence sparse). Length 4 mm .
myynicoides Ckll.
Thorax prriform, or considerably narrowed behind, where it is more or less romıded . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 9 .
9. Entirely jale ferruginous, with loug, rather dense, pale hair; second dorsal sparsely punctured. . . . . . . . . . . . . . . . . . . . . . . . . . . zepliynitis n. sp.
Head, thorax and first segment ferruginous, remainder of abdomen and greater part of legs black; pubescence rather short; second dorsal with strong, evenly sepirated punctures. .situctil-fege Ckll. and Fox.

The first seven species have the first abdominal segment rather elongate and narow, saarcely sessile with second, and distinctly contracted anteriorly from middle.
125. Mulillat ceyx n. sp.
b.-Dark testaceous, clothed with pale pubescence; antennte and legs paler; head broad, not much uarrowed and gently rounded behind; space between hind ocelli but little less than that between them and eyes: antennæ slender, a little longer than head and thorax united, first joint of flagellum almost as long as second, the srape longer than pedicel and first flagellum juint united; reticulation of middle segment coarse, above at base with three longitudinal, strong ridges, forming two smooth areas; first abdominal segment rather long, sparsely punctured, narrowed considerably from about middle to base; second dorsal sparsely punctured at sides, smooth medially; secoud ventral sparsely punctured; apical segments densely pubescent; wings subhyaline, nervures aud stigma testaceous. Length 14 mm .

Lower California: El Paraiso (May), and Catmalli Mines (April).

Two specimens collected by Chas. D. Haines. This species resembles M. nebulosus, under which name it is recorded in Proc. Calif. Acad. Sci. (2), iv, 5, 1894, but differs in shape of first abolominal segment.
126. Mintilla coloradensis D. T.

Photopsis abdominalis Blake (nee Westwood), Tr. Am. Ent. Soc., xiii, 275 §. Mutilla coloratensis Dalla Torre, Cat. Hym., viii, 25, §, 1897.
Colorado. Only the unique type seen.
127. Mutilla concolor Cress.

Mutilla concolor Cressom, Proc. Ent. Soc. Phila., iv, 439, §. 1865.
Agama concolor Blake, Tr. Am. Ent. Soc., iii, 262, \}, 1871.
Photopsis concolor Blake, ibid, xiii, 265 , \}, 1886.
Colorado ; Texas.
128. Mutillat Blakei Fox.

Photopsis Blakei Fox, Proc. Cal. Ac. Sci. (2), vi, 6, \}, 1893.
Mutilla gautsrhii Dalla Torre, Cat. Hym., viii, 43, \}, 1897.
Lower California. The name Blakei Fox, given in 1893, has precedence over Blukei Cameron, which did not appear until 1894. Dalla Torre's proposition to rename my species goutschii is therefore quite uncalled for.
129. Mntilla amphion n. sp.
§.-Castaneous, with pale pubescence; legs and antemæe more testaceous; head narrowed and rather evenly rounded behind, a little narrower than thorax ; space between hind ocelli slightly greater than that between them and eyes: antemme about as long as head and thoras, first joint of flagellum almost as long as second, the scape longer than the pedicel and first flagellum joint; reticulation of middle segment coarse, the two smooth basal a reas distinct, but the ridges enclosing them not so strong; first segment elongate, rather slender, sparsely punctured, narrowed anteriorls from middle; second dorsal very sparsely punctured, the second ventral more distinctly punctured, but still not strongly ; abdomen not banded with pubescence: wings subhyaline, faintly fuscons in vicinity of marginal cell and middle of hind margin of fore wings, nervures and stigma testaceous. Length 10 mm .

Nevada. Two specimens.

## 130. Mitillat triangularis Blake.

Agama triangularis Blake, Tr. Am. Ent. Soc., ii, 262. §. 1871.
Photopsis trianguluris Blake, ibid, siii, 263, \}, 18ะ6.
Nevala. Only the unique type seen. Quite distinct by shape of head.
131. Mutilla contrahenda $D$. T.

Agamu contracta Blake (nee Say), Tr. Am. Ent. Soc., viii, 253, 〕, 1879.
Photopsis contracta Blake, ibid, xiii, 265, §, 1886.

Nevada. A specimen from British Columbia, sent by Mr. W. H. Harrington, is larger and has the sutures of thoma blackish; but I can see no structural differences.

The following nine species have the first abdominal segment shorter and more nearly sessile with the second, thereby approaching the species which immediately follow them, differing, however, in that the segment mentioned is considerably contracted anterior to its middle, as in the preceding species of the group.

## 132. Mutilla palamedes n. sp.

§.-Head and thorax pale castaneous; abdomen dark-castaneous brown, the first segment paler; legs and anteune testaceons; head narrowed and rather evenly rounded behind, hardly as wide as thorax; space between hind ocelli about equal to that between them and eyes; anteme scarcely as long as head and thorax, the first joint of flagellum shorter than second, the scape nearly onethird longer than the pedicel and first thagellum joint; reticulation of middle segment tolerably coarse, coarser than in uro, the hasal smooth areas scarcely distinquishable from the surronding reticulation: first alodominal segment rather broad and convex, especially apically, with large, separated punctures: second dorsal vers sparsely punctured, the punctures of second ventral large and sparse; abdomen without bands of pubescence; wings subhyaline, withont fuscous spots, rather strongly iridescent, nervures and stigma testaceons. Length 8 mm .

Texas. One specimen.
133. Matilla uro Blake.

Agami uro Blake, Tr. Am. Ent. Soc., vii, 253, §, 1879.
Photopsis uro Blake, ibid, xiii, 273, §, 1806.
Texas
134. Mutillat juxta Blake.

Agame juxta Blake, Tr. Am. Ent. Soc, iv, ז6, \}, 15 iz.
Photopsis juxte Blake, ibid, xiii, 270, \}. 1886.
Texas.
135. Mutilla infelix D. T.

Photopsis inconspicuus Blake (nec Mutilla inconspicuns Sm.), Tr. An. Ent. Soc:, xiii, 2才2, \}, 1886.
Mutilla infelix Dalla Torre, Cat. Hym., viii, 50. §, 1897.
California; Lower California.
136. Mutilia nebulos:a Blake.

Photopsis nebulosus Blake, Tr. Am. Ent. Soc. xiii, 275, \}, 1856.
California.
13\%. Mntillat micolor C'ress.
Matilla unicolor C'resson, l’rue. Ent. Soc. Phila., iv, 359. §, 186 bī.
Agrma unicolor Blake, Tr. Am. Ent. Soc.. iii, 261. J, 1871.
Piotopsis unicolor Blake, ibid, xiii, 261, §, 1886.
Mutilla monochroa Dalla Torre, Cat. Hym., viii, 63, \}, 1s97.

California. Dalla Torre, supposing the genus Myrmosa a synonym of Mutillu, changed the name of this species to monochroa, as there is a Myrmosa micolor, which was described prior to the Mutilla unicolor. Myrmosa is a good genus however.
138. Mutilla anthophorie Ashm.

Sphærophthulmu anthophore Ashmead, Proc. South. Calif, Acad. Sci., i, No. 3, p. 5, 乌 \}, 1897.
California. This species is especially interesting, in view of the fact that both sexes are known, having been hred from the cells of a bee, Aanthophora.
139, Mintilla ristica Blake.
Agama rustica Blake, Tr. Am. Ent. Soc., vii, 252, \}, 1879.
Photopsis rustica Blake, ibid, xiii, 271, \}, 1886.
California. Only the unique type seen.
140. Mutilla mendica Blake.

Agamu mendicu Blake, Tr. Am. Ent. Soc., iii, 259. §, 1871.
Photopsis mendica Blake, ibid, xiii, 259, §, 1886.

## Nevada.

The following eleven species have the first segment evenly narrowed its entire length and not suddenly contracted before its middle, and is more sessile with the second segment, being quite short and broad in some species:
141. Mutilla pretiosissinma D. T.

Photopsis venustus Blake, Tr. Am. Ent. Soc., xiii, 270, §, 1886 (nec Mutillu renustus smith).
Mutilla pretiosissimu Dalla Torre, Cat. Hym., viii, 74, \}, 1897.
Arizona. Only the unique type seen. The peculiar flat head in this species is similar to that of the species of the genus Lydu.

## 142. Mutilla adonis n. sp.

§.-Castaneous brown, clothed with erect, white pubesceuce, the abdominal segments fringed or banded with pubescence of the same color; femora and tibix blackish, coxe and tarsi testaceons; second segment apically and following segments more or less fuscous; head about as wide as thorax, rounded behind: space between hind ocelli about equal to that between them and eyes, if anything, slightly less; antennæ fuscons above, pale beneath, the first joint of flagellum not two-thirds as long as second, the scape about one-quarter longer than the combined length of the pedicel and first flagellum joint and strongls punctured ; basal areas of middle segment large and distinct, reticulation large ; first abdominal segment evenly and strongly punctured, almost sessile with second, the sides straight, not suddenly contracted anterior to middle; puctures of second dorsal but little sparser medially ; pygidium distinctly margined laterally ; wings subhyaline, withont fuscous spots, nervares testaceons, stigma blackish. Length 15 mm .

New Mexico: Las Cruces, September, 1894 (Cockerell). One specimen.

## 143. Mutillat tapajos Blake.

Agumu tupajos Blake, Tr. Am. Ent. Soc., iii. 262. §, 1871.
Agemu astymax Blake, ihid, vis, 254, \}, 1879.
Photopsis tapajos Blake, ibid, xiii, 269,$\}, 1886$,
Photopsis astynux Blake, ibid, xiii, 272, \}, 1887.
Texas. There seems to be no appreciable differences between tapajos and astynax.
144. Mutilla anlus Blake.

Aguma unlus Blake, Tr. Am. Ent. Soc., iv, 75, §, 1872.
Photopsis aulus Blake, ibid, xiii, 270 , \}, 1886.
Texas. Only the unique type seen.
145. Mutilla pallida Blake.

Agamn pallida Blake, Tr. Amı. Ent. Soc., iii, 263, 乞, 1871.
Photopsis pallida Blake, ibid, xiii, 275, \}, 1886.

## Texas.

146. Mutilla Madejskii D. T.

Agama bicolor Blake, Tr. Am. Ent. Soc., vii, 25s, \}. 1879 (nec Mutilla bicolor Pallas).
Photopsis bicolor Blake, ibid, xiii, 271, §, 1886.
Mutilla madejskii Dalla Torre, Cat. Hym., viii, 56, \}, 1897.
Texas; Arizona.
147. Mutilla alemon n. sp.
§.-Testaceous, slightly brownish, clothed with whitish hairs: legs and antennæ much paler; head rounded behind, wider than thorax, finely punctured; space between hind ocelli slightly less than that between them and eyes; antenne hardly as long as head and thorax mited, scape abont one-third longer than the pedicel and first flagellum joint united: basal areas of middle segment distinct, almost as long as its upper surface; first abdominal segment indistinctly punctured, sides straight, not romnded anteriorly from middle, distinctly longer than broad at apex ; second dorsal smooth medially. sparsely punctured laterally, the second ventral sparsely punctured throughout; all the segments fringed at apex with short, whitish hair; wings subhyaline, strong, irideseent, without fuscous spots, nervures and stigma testaceous, the latter darker. Length 6.7 mm .

New Mexico: Las Cruces and S. Augustine (Cockerell). Four specimens.

## 148. Mutilla acontius n. sp.

§.-Yellowish throughout, with thin, pale puhescence; tips of mandibles black; head about as wide as thorax, rather evenly roundly behind and with large punctures; space between hind ocelli slightly less than that between them and eyes; antenme hardly as long as head and thorax united, the scape about
one－quarter longer than pedicel and first flagellum joint anited ；middle segment with a broad，central，smooth area，reaching from base two－thirds to the apex， the reticulation feehle and small；first abdominal segment sparsely punctured， rather narrow and convex apically，sides not narrowed anteriorly，from middle straight；second dorsal apparently impunctate，second ventral sparsely punc－ tured；segments not fringed；wings subligaline，iridescent，nervures and stigma yellowish．Length $5-\frac{7}{\mathrm{mmm}}$ ．

## New Mexico：Las Cruces（Cockerell）．Two specimens．

149．Mintilla Hyalinat Blake．
Aguma hyalina Blake，Tr．Am．Ent．Soc．．iii，263，ち． 1871.
Aguma minuta Blake，ibid，iv，76，\}, 1872.
Photopxis minuta Blake，ibid，xiii，2T：
Photopsis hyalinu Blake，ibid，xiii，274，\}, 1886.
Texas．There seems to be no specific difference between hyalina and minutu．The latter averages smaller in size．

150．Mutillat sarpedon $n$ ．sp．
\}.-Reddish castaneous, clothed with whitish pubescence; legs and flagellum blackish；head at most as wide as thorax，strongls punctured，rather square behind eyes；space between hind ocelli less than that between them and eres： antennæ shorter than bead and thorax united，first joint of flagellum nearly as long as second，the seape nearly twice as long as the pedicel and first flagellum joint united；thorax strongly punctured，especially the midde segment，which， unlike most species of the group，is not reticulate，unless the strong punctures， with which it is covered，may be said to form a reticulation，at the base medially are two elougate，parallel，smooth areas：first segment short and broad，sparsely punctured，practically sessile with second；second segment more strongly punc－ turel，especially beneath；segments fringed with a white pubescence，which is more evident when viewed laterally ；wings subhyaline，the anteriors crossed by a broad fuscous cloud between middle and apex，nervures dark，stigma black． Length 6－10 mm．
Texas．Eleven specimens．I found these confused with $M$ ． danuus，to which it is only superficially similar．

## 151．Mutillat thamyras $n$ ，sp．

§．－Black，elothed with a thin，pale pubescence；legs browner；head rounded behind；space between hind ocelli about equal to that between them and eyes： antenne shorter than head and thorax，the first joint of flagellum considerably shorter than second，the scape twice as long as pedicel and first flagellum joint； thorax strongly punctured；middle segment covered with large．deep punctures， with two elongate，parallel，smooth，basal areas；first abdominal segment sparsely punctured，tolerably sessile with second，comparatively narrowly than in hyalina or strpedon；second dorsal sparsely punctured medially，at the sides and on second ventral strongly punctured；segments not fringed；wings subhyaline． slightly fuscons，nervures dark，stigma black．Length $5 \frac{1}{2} \mathrm{~mm}$ ．

Texas．One specimen．

The following nine species are known in the female sex only :
152. Mutilla aurariat Blake.

Mutilla unraria Blake, Tr. Am. Ent. Soc., vii, 248, 乌, 1879. Sphærophthatme ancria Blake, ibid, xiii, 218, Y, 1886.
Nevada. Only the unique type seen.
153. Mutilla aspasia Blake.

Mutillu aspusiu Blake, Tr. Am. Ent. Soc., vii, 250, $\mathcal{\text { , }} 1879$.
Sphærophthelma aspusia Blake, xiii, 220, Y, 1886.
Nevada.
154. Mutillat plisedrat Blake

Mutilla phretra Blake, Tr. Am. Ent. Soc., vii, 251, ㅇ, 1879. Spherophthulmu phredra Blake, ibid, xiii, 219, ¢, 1886.
Nevada. Only the unique type seen.
155. Mutilla hypermmestran. sp.
Q. - Pale ferruginons, clothed above with appressed, dense pnbescence, except on second dorsal segment, which has long, erect hairs only ; the appressed pubesrence pale golden; pubescence of segments 3 and following dense: entire insect with long erect hairs: head not as wide as thorax ; first joint of flagellum but little longer than the second, the pedicel elongate, equalling it in leugth; scape about as long as the following four joints united; thorax short, truncate and narrowed behind, the sculpture of dorsal surface hidden by puhesceuce; first segment of abdomen short, sessile with second, the latter above with shallow pnnctures, which are more distinct on ventral surface; prgidium distinctly margined, very finely rugose. Length $3-5 \mathrm{~mm}$.

## California: Poway. Eleven specimens.

## 156. Mutilla erigone n. sp.

Q.-Ferruginous, thinly clothed with erect, pale pubescence; abdominal segments fringed with white pubescence apically ; head barely as wide as thorax, rugoso-punctate; thorax quadrate, short and broad, truncate and a little narrowed behind, rugoso-pmetate above; first abdominal segment sessile with second; second dorsal strongly punctured hasally, the punctures becoming sparser and feebler toward apex; pygidimm small, not margined, finely grannlated. Length 5 mm .

## Colorado. One specimen.

## 157. Mutillatilione $n$. sp.

Q.-Pale ferruginous, clothed with a sparse, appressed, silvery pubescence and erect, white hairs; abdominal segments not fringed: legs testaceons; head about as wide as thorax, with distinet, separated punctures: first joint of Hagellum nearly as long as following two joints united; thorax quadrate, short and broad, a little narrowed posteriorly, where it is hroadly truncate, the upper surface more finely punctured than head, excopt at apex, where it is reticulated: first abdominal segment short, sessile with second, the latter above with the senlpture iudistinct, but apparently punctured, beneath the segment is sparsely punctured: pygidium not margined, coriaceous. Length 4 mm .

Texas: Fedor, Lee County (Birkman). Two specimens.

## 158. Mitilia myrnicoides Ckll.

Mutille parvula Blake, Tr. Am. Ent. Soe., xiii, 206, Y, 1886 (nec Mutilla parvala Fabr.).
Spherophthalmu myrmicoides Cockerell, Ent. News, vi, 62, \&, 1695.
Alabana; Texas; Colorado. Cockerell's myrmicoides is synonymous with parvula Blake, but as the latter name is preoceupied, will have to be adopted for this species.
159. Mutilla zephyritis n. sp.
Q.--Ferruginous, elothed with a long, tolerably dense, pale puhescence; abdominal segment 2 and following with a fringe of pale hair; legs paler than body; head with coarse, confluent punctures, about as wide as thorax; first joint of flagellum about one-quarter longer than second; thorax pyriform, obtuse behind, rugoso-punctate above; first abdominal segment sessile with second, the latter above with sparse, rather feeble punctures, on the ventral surface the punctures are much stronger and less seattered; pygidjum sharply margined laterally, its sculpture indistinct. Length 7 mm .

California: Los Angeles County in May (Coquillett). One specimen belonging to the U.S. National Museum.
160. Mutillat sanctae-feat Ckll, and Fox.

Mutilla sanctæ-fere Corkerell and Fox, Proc. Acad. Nat. Sci. Phila., 137, ¢. 1897.
New Mexico. Only the unique type seen.

## Group hexagona ( $=$ Mutilla Blake, pt.).

Eyes strongly ovate, facetted, emarginate on inner margin in the male. Mandibles bidentate, emarginate on outer margin in the male, or rather with a blunt process near the base, which, in at least one species, is scarcely developed. Abdomen with segments 1 and 2 sessile, uniting evenly. Thorax of female oblong.

## MALES.

Process at base of mandibles largely developed, rarely wanting.......... ......2. Process at base of mandibles absent or rudimentary, the emargination therefore small.
7.
2. Pubescence of abdomen blackish or griseus, last ventral plate bituberculate.. 3. Pubescence of abdomen yellow. .4.
3. Head and thorax entirely black, with a mixed black and grisens pubescence; middle segment above with a smooth, median channel.
hexagonat Sity.
Head and thorax reddish in part.....................................................
4. Scape slender, scarcely widened at apex, not barbate; pubescence of head and thorax pale.
.- hesior n. sp.
Scape stouter, distinctly wider at apex and bearing a bunch of dense, pale hairs: puhescence of head and thorax hlack.

Grotei Biake.

## FEMALES.

Space between the eyes on an imaginary line drawn arross the middle of front is abont equal to twice the length of scape, or very little less; legs and abdomen varsing from black to red: segment 2 usualls with two silvery spots anteriorly, a silvery margin at apex of all segments.
dubitata Smith.
Space between eres by no means as great as twice the length of scape; legs black; abdomen red, with first and third segments entirely, apex of second, and fourth ventral entirely, black; second segment with a silvery margin, which, dorsally, extends forward medially for onequarter of the length of segment...................eriterpe Blake.

## 161. Mutilla hexagona Say.

Mutilla hexugona Say, Bost. Jonrn. Nat. Hist., i, p. 295, \}; LeConte Ed. Say's Entom.. ii, p. 738, 1859.
Mutilla hexagona, other authors.
Mutilla briaxus Brake, Tr. Am. Ent. Soc., iii, p. 22̃, §ิ, 1871.
I have seen specimens of this species from most parts of the United States, excepting the extreme western and southwestern regions. It is also found in Canarla and British Columbia. M. dubituta is probably the female sex.
M. briacus does not even represent a variety of this species.
$M$ vigilans Say, referred by some authors as a variety of hexagonu, evidently belongs near M. fenestruta, as far as can be ascertained from the meagre description by Say. At any rate, by the trmeated marginal cell it is distinct from hexagona, and, moreover, the abdomen is said to be differently colored, agreeing in many respects with the forms allied to fenestrata.
162. Mulilla dubitata Sm.

Mutilla dubitata Smith, Cat. Hym. Brit. Mus., iii, p. 60. 1855, O , and of $^{\text {, }}$ other anthors.
Mutille ornutirentris Cresson, Proc. Ent. Soc. Phila., iv, p. 435, 1865. Y, and of otber autbors.

This species has precisely the same geographical distribution as the preceding one.
M. ornativentris Cresson is synonymous with dubitata, the color of $\operatorname{leg}_{s}$ and abdomen varying from black to red, or vice versa.
163. Mutilla mestor n. sp.
§.-Head and thorax black, clothed with griseus pubescence, including the first abdominal segment; remainder of abdomen red, clothed with yellowish pubescence; head with deep, separated punctures; scape elongate, curved, but little widened apically, without a brush of dense pubescence; middle segment with a distinct, smooth. shallow channel above in the middle; first abdominal segment slightly longer than it is broad apically, with large, separated punctures, those of the second less strong and sparse medially; remaining segments more finely punctured; last ventral segment tuberculate; wings fuscous. Length 9 mm .

Texas. One specimen. Resembles Grotei, but is smaller, scape of antenur different, etc.

## 164. Mutilla Grotei Bl .

Mutilla Grotei Blake, Tr. Am. Ent. Soc., iii, p. 228, §, 1871.
Colorado. I have seen only the unique type of this species.
165. Mutilla promethea Bl.

Mutilla promethea Blake, 1. c., p. 229, §.
Georgia; Florida; Louisiana; Texas. The extent of red and black on thorax is subject to variation. Either this species or floridensis is probably the male of euterpe.
166. Mutilla ilorislensis BI.

Mutilla floridensis Blake, 1. c., vii, p. 249, 今, 1879.
Florida; Georgia. This is a less hirsute and smaller species than promethea, and the color is of a deeper red. The head varies from black to red. In the shape of first abdominal segment this species stands rather intermediate between the typical forms of group hexcogona and those of group serupea.

## 16\%. Mutilla Sayi Bl.

Mutilla Sayi Blake, 1. c., iii, p. 2299, §. 1871.
Texas; Colorado; Montana. Specimens from the two latter States differ from Texan examples in the lighter wings and greater extent of red on thorax.
168. Mutilla ruft Lep.

Mutilla rufu Lepeletier de St. Fargeau, Hist. Nat. Ins. Hy̧men., iii, p. 631, §, 1845; Blake, l. c., iii, p. 257, \}, 1871.
Described originally from Pennsylvania, and Blake gives "Atlantic States" as its habitat. There is but one specimen before me and that without locality.

It is doubtful, in my mind, if the species recognized as rufa by Blake is really that species, but the original description is too meagre to permit a positive conclusion in the matter.
169. Minilla enterpe Blake.

Mutilla euterpe 11lake, l. c., vii, p. 249, \&. 1879.
Florida. Only the unique type seen, which was collected at Enterprise, Florida, in May.
170. Mutilla barbata $n$. sp .
§.-Ferruginous, flagellum, legs and segments 3 and following black; scape yellowish, beneath with long, white hairs; pubescence griseus; flagellum acrminate, the basal joint broad and flat; first segment with large. separated punctures, as is also the second dorsal at base, the punctures becoming sparser medially and closer at apex ; wings subfuscous, the superiors crossed by broad, whitish yellow fascia medially. Length 8 mm .

Missouri: Ripley County (P. J. Smith). One specimen sent me by the Rev. Rich'd Kraus, of St. Vincent Abbey, Pennsylvania.
Group scrupea ( = Mutilla Blake, pt.).

Eyes short and broad, facetted, emarginate on inner margin in male. Mamdibles bidentate, not emarginate or bearing a process outwardly. Abclominal segment 1 distinctly narrower at apex than second, usually cylindrical. Thorax of female ovate.

The marginal cell tends rather to truncate, and the number of submarginal cells varies from two to three. Only one species, puteola, is known in the female sex.

> MALES.

Entirely black............................................................................ Say. More or less red.
2. Head and thorax hlack, abdomen red..........................copano Blake.

Ferrnginons, legs and antenne black........................slossonae n. sp.
171. Mutilla serupea Say.

Mutilla scrupea Say, Bost. Jour. Nat. Hist., i, p. 297. 1836, §; LeConte Ed. Say's Ent., ii, p. 740, §. 1859.
Mutilla scrupea Blake, 1. c., p. 230, §. 1871.
Mutilla gracilis Blake (not Smith), ibid, p. 231, §, 1871.
Connecticut; Delaware ; Texas; Colorado ; Montana; California. The western specimens are by far the larger, but I am unable to detect any satisfactory character entitling them to specific rank. These are the grucilis Blake (not Smith) ; the true grucilis inhabits Mexico, and has a more cylindrical first abdominal segment.

## 1\%2. Mntillat copanino Blake.

Mutilla copuno Blake, l. c., iii, p. 23», \}, 1871.
Texas; Mexico.

## 173. Mintilla Slonsonie n. sp.

\}.-Ferruginous, with sparse, pale pubesrence; legs and antemmo black; head with coarse, deep punctures; space between hind ocelli not equal to half that between them and eyes; first abdominal segment smaller than second, nodose, coarsely punctured and transversels carinated above, the ventral carina prominently elongated anteriorly ; second segment above with large, separated punctures, those of under surface coarser ; dorsals 3 \% sharply carinated down middle; wings subfuscous, marginal cell subtruncate; first and second segments with a fascia of white pubescence at apex. Length 8 mm .

Florida (Mrs. A. T. Slosson). One specimen.
174. Mutilla puteolat Blake.

Jutilla puteola Blake, l. e., p. 252, q, 15i9.
Texas; Florida: Lake Harney, May; Alabama: Selma, October ; Virginia: Pennington Gap. This is probably the female of scrupea.

## Unidentified Species.

1\%5. Mintilla argentipilis Prov.
Spherophthalma urgentipilis Provancher, Add. Hym. Quebec. 251, §, 185\%.
Florida.
176. Mutilla erecta Fox.
spherophthuma erecta Fox, Proc. Cal. Acad. (2), iv, 93, ¢, 1894.
Lower California. This species belongs to group camademsis. The type is in the coll. Calif. Academy of Sciences, so I have been unable to examine it.

## 177. Matillat figida Sm.

Mutilla frigida Smith, Cat. Hym. Brit. Mns., jii, 298, q, 1855.
Spherophthalma frigida Blake, Tr. Am. Ent. Soc., xiii, 239, 乌, 1886.
Arctic America: Great Bear Lake. The position of this species is doubtful from the description. It may be identical with $\boldsymbol{V}$. dubituta Sm., or closely allied.
178. Mutilla exulans Fabr.

Mutilla exuluns Fabricius, Srst. Ent., 397. $17 \% 5$.
"Habitat in America." This may not be a boreal American species.
179. Mutilla versicolor Fabr.

Mutilla versicolor Fabricius, Syst. Ent., 397, 1705.
"Habitat in America." Dalla Torre in his "Catalogue" gives Floridat as the habitat of this species.
180. Mintilla vingills Faby.

Mutillu vagans Fabricius. Ent. Syst. Suppl., 282, Y, 1798.
Boreal America.
1s1. Mufillat seciniliaz D. T.
Mutilla canadensis Provancher, Add. Hym. Quebec, 250, §, 1887.
Mutilla secunda Dalla Torre, Cat. Hym., viii, 84, \}, 1897.
Camada. This is not the same as Photopsis camadensis Provancher, or Sphuerophthulma canadensis Blake. It belongs to group hexagonu and may be a variety of that species.
182. Mntilla contractan Sas.

Mutille contructe Say, Bost. Jour. N. H., i, 295, \}, 1836.
Arkansas and Missouri. This is not the M. contructre Blake which is identical with hexagona. I am inclined to regard contructu Say as belonging to the series with tridentate mandibles, as, judging from the description, it has a third submarginal cell similar to the species of that series, notwithstanding that Say described the eyes as emarginate.
183. Mntilla tertia D. T.

Photopsis cuntulensis Provancher, Adr. Hym. Quebec, 410, 今. 1888 (nee Blake). Mutille tertiu Dalla Torre, Cat. Hym., viii, 91, §, 1897.
Canada. This is not the same as Mutillu canadensis Provancher.
184. Mudilla vigilans Say.

Mutilla vigilans Say.
This species is not identical with hexagona Say. See note under M. hexagona.

## II. Subfamily Thynnine.

The characters offered herein for the separation of the Mutilline and Thynnine have apparently never been used by previous writers in defining the Mutillidæ and Thymida, which have hitherto been generally regarded as families. The use of these characteristics necessitate the breaking down of old boundaries, so that some genera are relegated thereby from one family, or subfamily, into the other. For instance, the divided thorax of female and armature of tip of male abdomen remove Myrmosa, Methoca, Brachycistis and Chyphotes from the Mutillidre (Mutilline) into the Thymmide (Thynimne), which gives the latter sulfamily a strong representation in our fatha.

The Thyninne of the United States are divisible into five genera as follows:

## FEMALES.

Thorax divided into two parts.
Ocelli absent.
Abdomen attached to thorax by a slender petiole..... chyphotes Blake.
Abdomen sessile with thorax. . . . . . . . . . . . . . . . . . . . . IBrachyeistis Fox.
Ocelli present ; abdomen sessile with thorax. . . . . . . . . . . . . Myrinosat Latr.
Thorax divided into three parts.
Legs slender, not flattened; ocelli present.
Body strongly punctured; median tibize P-spurred. . . . . . . Marsymis n. g.
Body smooth, ant-like; median tibice 1 -spurred. . . . . . . . . . . Methocal Latr.
Legs short, strongly flattened ; ocelli absent........ (ilyptonetopai Ashm.
MALES.
Abdomen provided with a curved spine at tip.
Ocelli enlarged; mandibles stont ; venation confined to basal half of wing.
Median tibis 2-spurred Chyplnotes Biake.
Median tibize 1 -spurred ..... Hutelnyeistis Fox.
Ocelli normal; mandibles slender; venation almost reaching apex of wing.
Metinoert Latr.
Abdomen not spinose at tip.
Maxillae small, indistinct. Myrinosa Latr.
Maxillae large, elongate, prominent. ..... 'Teleplionomyia Gnerin.
The males of Glytometopu and Morsyma are unknown.
CIIYI'IC'IES Blake.

This genus contained but one species C. elevatus Blake, and only the female was known until Mr. Ashmead discovered several species described as Photopsis and representing the male sex. These were Photopsis ullipes, belfragei, melaniceps and attemuta. To these should be added Photopsis nubeculu, mellipes and picus, the two latter now being referred to the synonymy. Mutilla peculiaris Cresson is also a Chyphotes.

## FEMALES.

Node of first abdominal segment broader than long, the petiole entering it bencath; no silvery ornamentation ; eyes irregularly ovate, smooth and shining.

$$
\cdot 2 .
$$

Node of first segment longer than broad, joined with petiole in such a way as to be continuous with it ; body ornamented with silvery puhescence; eyes elongate-ovate, distinctly facetted................ectulianis Cress.
2. Legs more or less dark; third dorsal blackish.3.

Legs pale testaceons; abdomen concolorons, not at all black................... 4 .
3. Second dorsal segment with shallow, scattered punctures, the second ventral with coarse, scattered punctures, those on thorax above tolerably large aurl separated. Length $9 \mathrm{~mm} . .$. .....................elevatus Blake.

Second dorsal segment with rather close, coarse punctures, especially toward base: second ventral with sparse, shallow punctures; thorax above

4. Petiole short. stout, not as long as hind tibia, somewhat curved; second ventral with rather fine, sparse punctures. Length 9 mm .
testiceipes n. sp.
Petiole comparatively longer and slender, as long as hind tibia, straight; second ventral segment with large, scattered punctures. Leugth 4-6 mm .
petiolatus $n$. sp.

> MALES.

Wings with two submarginal cells. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2 .
Wings with three submarginal cells. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 5.
2. Second submarginal cell as long as first, not triangular; abdomen coarsely punctured
. 3.
Second submarginal cell small, not half the size of first, triangular; swollen portiou of first segment rugoso-punctate, the second dorsal with large, separated punctures (head obtusely rounded behind).
attennintin Blake.
3. Head truncate behind, not much produced behind eyes; petiolated portion of first segment shorter than first medial tarsal joint, the enlarged portion broadly ovate; legs as a rule blackish or testaceons-brown.

Belfiragei Blake,
Head rounded behind, considerably produced behind eyes.

4. Segments 1 and 2 rogoso-punctate : petiolated portion of first segincut, if anything, shorter than first joint of median tarsi ; head black.
nelanieeps Blake.
Segments 1 and $\approx$ with strong, even, separated punctures; petiolated portion of first segment fully as long as first joint of median tansi ; head concolorous with remainder of insert, castaneous.peninsilanis n. sp.
5. Third submarginal cell distinctly broadened above; first and second trans-verso-cubital veins uniting above; stigma nsually brownish.
atlibipes Cress.
Third submarginal cell not or scarcely widened above; first and second trans-verso-cubital veins somewhat separated above; stigma hlackish.
nimbecinlat Cress.
Chyphotes is divisible into two groups or subgenera, one represented by C. peculiaris and the other containing all the other species.

1. Chyphotes elevitis Blake.

Chyphotes elevutus Blake, Tr. Am. Ent. Soc., xiii, 276, t, 1886.
Mutilla elevata Dalla Torre, Cat. Hym., viii, 34, ㅇ, $18 \$ 7$.
Arizona; New Mexico: Santa Fé, August (Cockerell). The California examples mentioned by Blake are a different species, which I describe as C. petiolatus.
2. C'ingpliotes pinietatins n. sp.
Q.-Ferruginous, with sparse, white hairs; third dorsal segment and femora
blackish ; antenne and tarsi testaceous; head strongly punctured : thorax rugnsopunctate above; second dorsal segment with strong, rather close punctures, especially toward base, those of first dorsal feebler and sparser, as are likewise those of second ventral. Length 4 mm .

Arizona: Chiric Mts., July 29th (H. H. Hubbard). One specimen in collection of U.S. National Museum.

## 3. Chyphotes testaceipes 1 sp .

Y.-Testaceo-ferruginous, cluthed with long, palish, not whitish, hairs; abdomen concolorons; legs and antenne testaceons; punctures of head strong and separated; thorax with strong, separated punctures; petiole short, stout, not as long as hind tibiæ, curved ; first and second dorsal segment with separated punctures, less strong and more separated than in elevatus and punctutus; punctures of second ventral small, sparse and shallow. Length 9 mm .

Arizona: Phoenix (H. G. Griffith). One example. This species is more hairy than either of the two preceding species.

## 4. Chyphotes petiolatus n. sp.

¢.-Testaceo-ferruginous, clothed with long, grayish pubescence, beneath which there is, in some specimens, a shorter, appressed, yellowish pubescence; antennæ and legs testaceous; abdomen concolorous; punctures of head and thorax practically the same as in C. testaceipes, perhaps a little closer on thorax; petiole about as long as hind tibiæ, rather slender, straight; first and second dorsal segments with strong, seprarated, ronnded punctures, those on second ventral larger, deejer and sparser, especially sparse medially. Length 4-6 mm.

The following six species are koown in the male sex only. Of these attenuata, Belfragei, peninsularis and melaniceps have two submargimal cells, whereas in mubecula and albipes there are three submarginals.
5. Chyphotes Belfragei Blake.

Agama Belfrugei Blake, Tr. Am. Ent. Soc, iii, 263, §̂, 1871.
Photopsis Belfrugei ibid, xiii, 263, §, 1886.
Mutilla Belfragei Dalla Torre, Cat. Hym., viii, 15, §, 1897.

## Texas; Arizona; New Mexico.

6. Chyphotes melaniceps Blake.

Photopsis melnniceps Blake, Tr. Am. Ent. Soc., xiii, D64, §, 1856.
Mutillu melaniceps Dalla Torre, Cat. Hỵm., viii, 60, \}, 1897.
The type of this species is without locality label. Blake gave Arizona as its habitat.
7. Chyphotes peninsularis n. sp.
\}.-Castaneous-brown, clothed with long, whitish pubescence, which is thickest on abdomen; legs pale testaceons, the antenme slightly darker; head rounded and considerably produced behind eves, with distinct, separated punctures; dorsulum ponctured about like the head and not as strongly as in melani-
ceps: petiolated portion of first aldominal segment fully as long as the first joint of medial tarsi, the enlarged portion elongate-ovate, with rather coarse, close pmetures; second dorsal with similar punctures, but they are more separated: third dorsal witis sparse, fiuer punctures; wings subhyaline, slightly yellowish, with a fuscous cloud near apex, nervures and stigma testaceous, two submarginal rells. Length 12 mm .

Lower California. One specimen.

- Chyphotes atteninata Blake.

Aguma attemuta Blake, Tr. Am. Ent. Soe., iv, 76, \}, 1872.
Photopsis rttentuth Blake, ibjd, xiii, 264, \}ै, 1586.
Photopsis mellipes blake, ibid, xiii, 26:2
Photopvis picus Cockerell, ibid, xxii, \}
Mutilla picus Dalla Torre, Cat. Hym., viii, 73, \}, 1897.
Mutilla temulu Dalla Torre, ibid, viii, 91, $\widehat{\delta}, 1897$.
Texas; Arizona ; New Mexico. I have seen the type of Plotopsis picus Cockerell, and have no doubt as to its identity with Chyphotes attenmutus, with which the description agrees. Photopsis mellipes Blake, which I formerly held to he identical with Belfragei,* is the same as attemuatus.

## 9. Chyplotes albipes Cress.

Agamu albipes Cresson. Tr. Am. Ent. Soe., v, 99, \}, 18ı4; Rep. Geogr. and Geol. Explor. and Surv. 100th Mer., v, 711, pl. 33, f. 2. §, 1875.
Photopsis albipes Blake. Tr. Am. Ent. Soe., xiii, 268, §, 1886.
Mutille allipes Dalla Torre, Cat. Hym., viii, 7, \}, 1897.
Nevada; Colorallo.
10. Chyphotes nubeculus Cress.

Mutilla mbecula Cresson, Proc. Ent. Soc. Phila., iv, 440, \}ै, 1865.
Agrma mulecula Blake. Tr. Am. Ent. Suc., iii, 264, §, 1871.
Photopsis unbecula Blake, ibid, xiii, 266, \}, 1ss6.
Mutilla mubeculu Dalla Torre, Cat. Hym., viii, 67, §, 1897.
Colorado. This species is peculiar by having the fourth and fifth ventral segments furnished with two brush-like bunches of stiff, bristle-like hairs, therehy differing from all the other known species.
M. peculiaris is quite distinct in the slape of first abdominal segment, facetted eyes and silvery ornamentation from the other species of the genus. These characters, in this case, are not of greater value than subgeneric.
11. Chyphotes peculiaris ('ress.

Mutilla peculiaris Cresson, Tr. Am, Ent. Soc., v. 119, Q, 1875.
Chyphotes mirabilis Cockerell, (an, Ent., 284, ㅇ, 1896.
California; New Mexico (Cockerell).

[^2]HRACHYCINTIN Fox.
The two species herein, considered as females of this group, difler from the males in having a two-spurred medial tibia. It is therefore not certain that these are really the female of Brachycistis, inasmuch as in the other genera of the family the number of spurs of the tibire does not differ in the sexes. Nevertheless, it has been thought advisable to keep the specimens in question in this position until something definite may be learned of their hahits, etc. Should they prove not to be Brachycistix, then that genus is the only one of the North American Mutillide, of which but one sex is known. To be sure, Mr. Ashmead has already characterized the female of this genus as having a me-spured medial tibise, but he does not state on what species this assertion is based ; so I take it for granted that the genus was not known to him in the female sex, and that the characterization in question was put forth hypothetically.
MALES.
First abdominal segment elongate, drawn out anteriorly into a slender neck...2.First abdominal segment short, generally sessile with second, not drawn ont intoa sleuder neck anteriorly.14.
2. Head very small, narrower than thorax : form nonsually slender; first seg-ment almost linear. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .animisi Blake.
Head at least as wide as thorax; form more robust; first segment varyingfrom a sleuder, elongate form to almost campanulate. . . . . . . . . . . . . 3 .
3. Marginal cell nearly as long as the stigma. ..... islotes Ckll.
Marginal cell moch shorter than stigma, not more than half as long at themost4.
4. First segment elongate, its width at apex not by any means as great as half its lengthFirst segment shorter, broad at apex, which width is equal, or nearly so, tohalf the length of the segment. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 10 .
5. Thorax and abdomen entirely castaneous. .....  6.
Thorax and abdomen black or quite dark ..... 8.
6. Head scarcely narrowed behind, concolorons with thorax (second submarginal cell variable).Head black7.
7. First segment slender, at least one quarter longer than second; abdomen nothirsute; thorax, abdomen and legs dark castaneous; bead considerablynarrowed behind eyes. . . . . . . . . . . . . . . . . . . . . . . . . . . . ninalis n. sp.
First segment stont, not one-quarter longer than serond, abdomen sparselypuhescent; thorax and abdomen light castaneous, legs testaceous;antenna orange; hear but little narrowed behind eyes.
elegantulus Ckll.
8. Stigma of wings pale yellow; legs, except coxa, mandibles and antennæ, rel-lowish; thorax brownish or wine colored.
petiolatns Fox.
Stigma of wings and legs, except tibire and tarsi, black: antenne variable; borly entirely black ..... 9.
9. Abdomen very sparsely pobescent: second dorsal indistinctly panctured... 10 .
Abromen with rather dense, white pubescence; second dorsal with large,separated punctures. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . atiratat Blake
10. Head produced behind eyes, subtruncate behind; third smbmarginal cell longer than high...............................................
Head evenly rounded behind, not prodnced behind eyes; third submarginal cell higher than long. . . . . . . . . . . . . . . . . . . . . . . . éonifinguis n. sp.
11. Head black ..... 12.
Head concolorous with thorax ..... 13.
12. Upper surface of middle segment bounded by a sharp ridge.
Cal'initins n. sp.
Middle segment not ridgedglabrellat Cress.
13. Space between hind ocelli considerably greater than that between them anderes, the latter black; head narrowed behind....inarainalis n. sp.
Space between hind ocelli about equal to that between them and eyes, thelatter greenish; bead but little narrowed behind.
sibqualiratins m. sp.
14. Marginal cell at least half as long as stigma; three submarginals ..... 15.
Marginal cell very small, not half as long as stigma; two submarginals.
perp\|nctaths Ckll
15. Third submarginal cell elongate, longer than high ..... 16.
Third submarginal cell shorter that high or quadrate. ..... 17.
16. Marginal cell fully as long as the stigma; first and second transverso-enbital veins not uniting above. .................................equalis n. sp.Marginal cell shorter than stigma; second submarginal cell almost petiolate.nevadensis n. sp.
17. Body entirely custaneous. ..... 18.
Head black : abdomen fuscous beyond first segment; second submarginal cellpetiolate, with a long petiole; third submarginal subquadrate.
indisaretis n. sp.
18. First and second submarginal cells nearly equal in length; space betweenhind ocelli abont equal to that between them and eyes; color darkcastaneous................................................astabeus Cress.
Second submarginal cell triangular, much smaller than first, almost petiolate;space between hind ocelli greater than that between them and eyes.
trisungularis n. sp.
19. Castaneous; antenne and legs testaceous; first and second submarginalsnearly equal in lengthbrevis n. sp.
Black ; antenne brownish ; second submarginal cell triangular, staaller thanthe firstperpunctatus Ckll.
FEMALES.
Dark castaneous ; two spots on second segment and one at base of sixth yellow ; dorsals 1-3 blackish at apex. Length $6 \mathrm{~mm} . .$. ....rutilans Blake.
Testaceo-castaneous; two spots on second dorsal and sixth dorsal at base and apex yellow ; third dorsal blackish. Length 4 mm .

bimaculatus<br>n. sp.

1. Brachycistis amplus Blake.

Ayama umpla Blake, Tr. Am. Ent. Sue., vii، 25\%, §. 1879.
Photopsis amplus Blake, ilid, xiij, 266. §, 1886.
Brachycistis amplus Fox, Ent. News, v, 296, 1894.
Mutilla umpla Dalla Torre, Cat. Hym., viii, 8, 1597.
Colorado: Custer (Cockerell).
2. Hratchyristis idiotes Ckll.

Bruchycistis idiotes Cockerell. Ent. News, vi, 63, §, 1895.
Mutilla idiotes Dalla Torre, Cat. Ḩm., viii, 49, 1898.
New Mexico: Las Cruces, November 21st (Cockerell).
3. Brachyeistis nitidus Cress.

Agamı nitila Cresson, Wheeler's Survey W. 100tin Mer., v. 710, \}, $15 \% 5$.
Photopsis uititus Blake, Tr. Am. Ent. Soc., xiii, 26\%, \}. 1886.
Photopsis sobrinns Blake, ibid, xiii, 268, §, 1886.
Photopsis lepiflus Blake, ibid, xiii, 269, \}, 1886.
Brachycistis nitidns Fox. Ent. News, v, 296, 1894.
Brachycistis lepidus Fox, ibid.
Brachycistis sobrinus Fox, ibid.
Mutillu lepida Dalla Torre, Cat. Hym., viii, 52, 1897.
Mutilla nitidu Dalla Torre, ibid, viii, 66, 1897.
Mutilla sobrina Dalla Torre, ibid, viii, 86, 1897.
Colorado; New Mexico. I am unable to detect specific differences in nitidus, sobrimus and lepidus. The convexity of first segment seems to vary, the segment being tolerably flat in nitidu, and decidedly convex in lepidus, the intermediate form existing in sobriuns.
4. Brachyeistis mulus n. sp.
§.-Dark castaneous, legs darker; head black; antenne brownish: tarsi testaceous; entire insect almost node, except for a few hairs on the thorax beneath: head distinctly narrowed behind; space between hind ocelli greater than that between them and eyes; dorsthm indistinctly punctured; middle segment smooth above, posterior surface with large, sparse punctures apically: first abominal segment strongly punctured hasally, elongate, the basal portion quite slender, with the apical portion swollen, so as to make it clavate; remaining segments distinctly punctured, but not closely: wings subhyaline; nervares testaceons; stigma dark brown; second submarginal cell triangular, the first and second transverso-cubital veins miting above; marginal cell about half as long as the stigma. Length 10 mm .

## California. One specimen.

The third submarginal cell is partially obliterated in the specimen before me, which possesses but one superior wing, but from appearances it is quadrate in perfect specimens, and is quite as long as the seeond submarginal on the cubital nervure.

## 5. Brachycistis petiolatins Fox.

Bruchycintis petiolutus Fox, Proc. Calif. Ac. Sc. (2), iv, 8, §, 1893.
Mutilla petiolata Dalla Torre, Cat. Hym., viii, $72,1897$.
Lower California: Calmalli Mines, April.

## 6. Urathyeistis migritus n. sp.

§.-Black, clothed with thin. pale bnbescence, especially on abdomeu; tibiæ and tarsi pale brownish, the tarsi palest; antenne brown; head transverse, narrowed hehind, but not strongly; space between hind ocelli distinctly greater than that between them and eyes; middle segment with large, shallow punctures posteriorly; first dorsal segment strongly punctured, much broader at apex than at base, strongly convex apically, in length somewhat greater than the second segment, remaining segments with shallow, seattered punctures, those on second ventral largest; wings subhyaline, nervures testaceons, stigma blackish; marginal cell barely half as long as stigma: third submarginal larger than second, but little narrowed above. Length $8-10 \mathrm{~mm}$.

Washington ; Nevada. Two specimens.
\%. Hrachycistis contigums n. sp.
S.--Close to nigritus, but differing by the head being evenly rounded behind, not produced behind eyes; slenderer form; third submarginal cell higher than long, the second nsually petiolate or nearly so; middle segment finely punctured posteriorly. Length $7-8 \mathrm{~mm}$.

## Nevada. Five specimens.

8. Brachycistis atratis Blake.

Agumu atrata Blake, Tr. Am. Ent. Sof., vii, 253, §, 1879.
Photopsis atratu Blake, ibid, xiii, 268, $\delta, 1806$.
Mutilla agama Dalla Torre, Cat. Hym., viii, 7, 1897.
Nevada.
9. Brachycistis elegantulus Ckll. and Casad.

Brachycistis elegantulus Cockerell and Casad, Ent. News, v, 295, \}ో, 1894.
Mutilla eleguntula Dalla Torre, Cat. Hym., viii. 34, 1897.

## New Mexico: Las Cruces.

10. Brachycistis ingequalis $n$. sp.
§.-Pale castaneous, sparsely clothed with pale, not whitish pubescence; legs testaceous; antenne darker; head narrowed behind eyes, subtruncate behind; space between hind ocelti distinctly greater than that between them and eyes, the latter black; first abdominal segment slender basally, but greatly broadened at apex, rather campanulate, covered with shallow, not strong punctures: wings subhyaline, nervures and stigma testaceous, the latter darkest; marginal cell barely half as long as stigma; third smbmarginal subquadrate, slightly longer than high, the second triangnlar, shorter than the third on the cubital nervure. Length $10-11 \mathrm{~mm}$.

California: Los Angeles, September. Twelve specimens. Type in collection of U.S. National Museum.
11. Brachyeistis subquadratus $n$. sp.
\}.-Pale castaneous, clothed with sparse, pale pubescence; antennæ paler:
legs brownish, tarsi testaceous; head subquadrate, produced, but not minch narrowed behind eyes: space between hind ocelli abont equal to that between them and eyes, the latter greenish; first abdominal segment not very narrow basally, broadened from near base gradually to apex, sparsely and rather strongly punctured: wings subhyaline: nervures testaceous; stigma dark brown; marginal cell not more than half as long as stigma; third submarginal higher than long, shorter than the second on the cuhital nervore: second submarginal cell triangular, the first and second transverso-cubital veins not meeting above. Length 10 mm .

## California. One specimen.

12. Brachyeistis glabrellat Cress.

Mutilla glabrella Cresson, Proc. Ent. Sor. Phila., iv, 441, \}, 1865.
Agamu glabrella Blake, Tr. Am. Ent. Soc.., iii, 264, b, 1571.
Agamu alcanor Blake, ibid, iii, 264, \}, 1871.
Photopsis alcumor Blake, ihid, siii, 267, \}, 1886 .
Photopsis glabrella Blake, ibid, xiti, 274, \}, 1=56.
Mutilla alcanor Dalla Torre, Cat. Hym., viii, \&, 1897.
Mutilla glabrellu Dalla Torre, ibid, viii, 22, 1897.
Colorado; Texas; New Mexico; Arizona; California. B. ulcunor is apparently not distinct from glabrella.

## 13. Brachycistis carinatas $n$. sp.

ई.-Castaneous, very sparsely pubescent ; head black; antennæ and eyes pale (astaneous : tarsi rather testaceons; head produced and a little narrowed behind eyes; space between hind ocelli greater than that between them and eyes: dorsulum and scutellum with distinct, sjomse pnnctures; middle segment with a sharp, transverse ridge medialls, which runs to the hase at sides, thereby enclosing the apper surface, which is rather deeply snlcate down middle: first segment of abdomen long, greatly broadened at apex, slender basally, with sparse punctures; wings subliyaline, nervures and stigma dark brown: marginal cell not twothirds as long as stigma; third submarginal about as long as high, much larger than the second, which is subtriangular, and much shorter than the third on the cubital nervure; first and second transverso-cubital veins not meeting above. Length 14 mm .

California. One specimen.

The next seven species have the firs abdominal segment short and broml, not produced into a slender neck anteriorly.
14. Brachycist is castaneus Cress.

Mutillt castanea Cresson, Tr. Ant. Ent. Suc., iv, 38s, §, 1~65.
Agamu castanea Blake, Tr. Am. Ent. Soc, iii, 264, 1871.
I'hofopsis custunen Blake, ibid, xiii. 273, 1886.
Mutillu custanea Dalla Torre, Cat. Hym., viii, 21, 1897.
California; Arizona; Lower California.
15. Hrachycistis nevademsis n. sp.
§.-Pale castanens, sparsely clothed with pale, not whitish pubescence; legs
testaceous; antemar darker; head scarcely narrowed or produced behind eyes, subromded behind ; space between hind ocelli much greater than that hetween them and eyes; dorsuhum and scutellum with distinct, sparse punctures; middle segment with large, shallow punctures posteriorly : first abdominal segment convex, broadened from base to apex. finely punctured medially, more strongly toward sides, in length somewhat longer than seeond, subpyriform ; wings subhyaline. nervures and stigma testaceous; marginal cell nearly two-thirds as long as stigma; third submarginal subquadrate, longer than high ; second submarginal small, subpetiolate, much shorter than third on cubital nervure. Length 10 mm .

Nevada. One specimen. The first segment is rather similar to that of glabrellu, etc., but the basal neck is quite stout, not sleuder.

## 16. Hifachyeistis indiscretus $n$. sp.

\}.-Head black; thorax and first segment pale castaneous; segments 2 and following dark brown or blackish; apical margins of segments, legs and antenne testaceous; pubescence sparse and pale; head somewhat produced behind, very little narrowed; space between hind orelli about twice as great as that hetween them and eyes; thorax indistinctly ponetured; middle segment not ridged or roughened; first ahdominal segment rather short and broad, distinctly. but not strongly punctured, other segments indistinctly punetured; wings subhealine; nervures testaceons; stigma brown; marginal cell a little longer than half of stigma; third suhmarginal cell nearly quadrate, if anything, higher than long; second submarginal petiolate, much shorter than the third on the enbital nervure. Length 6 mm .

Arizona: Willcox, July 24th (Hubbard). One specimen in collection of U. S. National Museum.
17. Brachycistis aequalis n. sp.
, §.-Pale castaneons, elothed with sparse, whitish pubescence; antenuæ paler; legs palest, tending to testaceous; bead somewhat produced behind eyes, but sicarcely narrowed; space between hind ocelli greater than that between them and eyes; thorax strongly punctured, the dorsulam and scutelfam sparsely; mesosternm presenting two ather prominent convexities, which are more or less transversely striated as well as punctate, the strize hardly evident in one example; middle segment roughened posteriorly, the upper and posterior surfaces separated by a sharp ridge, sulcus of upper surface broad ; first abdominal segment short and broad, strongly punetared, barely as long as second segment; wings subhyaline; nervares and stigma brownish; marginal cell equalling the stigma in length; third sulmarginal much longer than high; second subtriangular about as long as third on cubital nervore; the anst and second transversocubital veins widely separated above. Length $12-13 \mathrm{~mm}$.

## Colorado; Nevada; Arizona. Four specimens.

## 18. Brachyeistis triangularis n. sp.

§.-Pale castaneons, clothed with a tolerably dense, whitish pubescence; legs tending to testaceous; head a little prodneed behind, but not narowed; space between hind ocelli greater'than that between them and eyes; mesostermam with large, sparse punctures, the meschleure with closer punctures; middle segment roughened behind, especially above, not ridged, the sulcus of npper surfaces
shallow; first segment short and broad, rather pyriform, strongly convex posteriorly and with strong punctures; wings subhyaline, nervires and stigma testaceous, the latter sometimes brown; marginal cell about equal to two-thirds the length of stigma; third submarginal higher than long: second triangular generally subpetiolate, almost equal to the length of the third on the cubital nervire. Length 9 mm .

## Arizona. Four specimens.

## 19. Brachycistis brevis n. sp.

\}.-D'ale castaneous, sparsely clothed with pale pubescence; antennæ and legs testaceons, the latter palest; head very little produced and not narrowed behind; space between hind ocelli greater than that between them and eyes; ponctures of thoras large and sparse, closest on mesopleure. sparsest on dorsulum; upper and posterior surfaces of middle segment ronghened at sides, and the portion dividing them also ronghed, otherwise comparatively smooth, except in the sulcus of aprer surface; abdomen with strong, scattered punctures; first segment short and broad, almost as wide at apex as base of second; wings subhyaline, nervares and stigma testaceous; marginal cell very short, barely equalling half of the stigma in length; two submarginals of nearly equal length, the second sulpetiolate; second recurrent vein interstitial with the second trans-versu-cubital vein. Length 9 mm .

California. One specimen.

## 20. Brachycistis perpunctathas Ckll.

Brachycistis perpunctutus Cockerell, Tr. Am. Ent. Soc., xxii, p. 291, \}, 1895. Mutilla Belfragei Dalla Torre, Cat. Hym., viii, 15, 1897.
New Mexico: Las Cruces. This species is not at all similar to Chyphotes Belfragei, with which Dalla Torre has coufused it in his "Catalogue."

The following two species are represented in the female sex only:
21. Brachycistis rutilans Blake.

Mutilla rutiluns. Blake, Tr. Am. Ent. Soc., vii, 245, P, 1599. California.

## 22. Brachycistis bimaculaths $n$. sp.

¢.-Pale castaneons, sparsely clothed with short, pale pubescence; thorax above with a whitish, pale, not vers dense pubespence; head and thorax finely punctured; legs paler than thorax ; second dorsal with two widels separated, pale rellowish spots; second and third dorsals apically, and sixth medially fuscous, the latter yellow at hase and apex. Length 4 mm .

Missouri : Ripley County (P. J. Schmitt). One specimen sent to me by Rev. R. Kraus.

MYEMOSA Latreille.
Of the four species at present described from the United Stater, only one is known in the female sex, M. thoracica, and there is little doubt but that this will prove to be the female of $M$. unicolor, as both inhabit precisely the same regions.

## MALES.

Second submarginal cell triangular, smaller than third, the first and second transverso-cubital veins uniting above: head, thorax and abdomen coarsely punctured: first ventral abdominal segment with a hook at hase, the second ventral unarmed; hind coxæ with a blunt tooth or lamellate process above...................................unicolor Say.
Second submarginal cell elongate, larger than third, the first and second trans-verso-cubital veins widely separated above: body finely punctured; first ventral not hooked.
?. Hind coxse above with a distinct spine; insect black, at most with tip of abdomen reddish; third subinarginal narrowed above, higber than long.
parvulat Fox.
Hind coxe with a blunt tooth or lamellate process; head, thorax and legs black, abdomen ferruginous; third submarginal quadrate, longer than high.
rinfiventris Blake.

## FEMALES.

M. thoracica, the only American species known in the female sex, is coarsely punctured; ferruginons, with abdomen more or less blackish above ; first segment transversely carinated above, beneath prominently produced at base; the front of head is usually blackish.

## 1. Myrinosa minicolor Say.

Myrmosa unicolor Say, Keating's Narrative Long's Expedition St. Peter's River, etc., ii, 331, §, 1824; LeConte's Ed. Say's Entom., i, 222, 1859.
Ischiocerus rugosa Provancher, Nat. Can., xiii, 8, \} (not 9 ), 1882.
Mutilla unicolor Dalla Torre, Cat. Hym., viii, 94, 1897.
Canada, southward to Virginia, thence westward to Colorado. Very variable in size. The base of second ventral segment may be tuberculate or not. I have Provancher's type of Ischioceras rugosu before me. It is identical with M. unicolor, save for an anomaly of venation, the second transverso-cubital vein being abbreviated and represented by a mere stump, which does not reach half-way to the marginal cell. The description by Provancher of the male probably applies to Methoca stygia.
2. Myrmosat parvinlat Fox.

Myrmosa parmula Fox, Journ. N. Y. Ent. Soc., 53, §, 1893.
Mutilla entisemitica Dalla Torre, Cat. Hym., viii, 10, 1897.
Illinois; Montana.
3. Myrmosit rufiventris Blake.

Myrmosa rufiventris Blake, Tr. Am. Ent. Soc., vii, 254, §, 1579.
Mutilla erythroguster Dalla Torre, Cat. Hym., viii, 36, 1897.
Nevarla. Only the unique type seen.
4. Myrmosat thoracicat Blake.

Mutilla thoracica Blake. Tr. Am. Ent. Soc., xiii, 204, Y, 1886.
Mutille erythronota Dalla Torre, Cat. Hym., viii, 36, 1897.
Generally distributed, as M. unicolor.

MORSYMA * gen, nov.
Female apterous; eyes facetted; three distinct ocelli; thorax divided into three parts; legs graceful, not flattened; tibial surs 1-2-2; claws simple; abdomen fusiform, not carinate, the first ventral unarmed; no pygidium ; body strongly punctured. Male unknown.

## 1. Morsymat Ashmeadii $n$. sp.

q.--Head and thorax and first segment ferruginous; abdomen, except first segment, legs and antenne black: pubescence long and black, a whitish fringe at apex of second dorsal: head with large, separated punctures, wider than thorax; mandibles acute, armed with a tooth within before apex ; thorax rugose above, punctured on sides, except on middle segment, the sides of which are smooth; abdomen finely punctured, except on second ventral, where the punctures are large and separated. Length 6 mm .

California: Napa County (Coquillet). One specimen in collection of the U. S. National Museum.

Morsyma differs from Myrmosa in the tripartite thorax, and while agreeing in that respect with Methoca, differs from it in the coarsely sculptured body, two-spurred medial tibie, etc. It is clearly relaterl to both of these genera.

METHOCA Latreille.
Of the four species at present on our lists, M. pacalis Harris must be excluded, as it was never describerl ; M. canadensis Smith is apparently synonymous with M. stygia; and M. californicus will probably turn out a variety of $M$. bicolor; the latter is very likely the female of $M$. stygia.

> MALESS

## FEMALES.

Head black; remainder of iusect castaneous in greater part. . . . . .bicolor say. Head concolorous with greater part of body, castaneous. californical Westw.

[^3]1. Methoea stygisi Say.
? Mutilla (Methoca) pucilis. Harris, C'at. Anim. Mass. Insect, p. 587, 1835 (no (description).
Tengyra stygiu Say, Bost. Journ. Nat. Hist., i, 299. §, 1836.
Methoca canadensis Smith, Cat. Hym. Brit. Mus., iii, 67, §, 185.5.
Ischioceras rngosa Provancher, Nat. Can., xiii, 8, (excl. ㅇ), 1882.
Methoch stygia Blake, Tr. Am. Ent. Soc., xiii, 280, §, 1886.
Occurs from Canada to Virginia, westward to Montana and Nevala.
2. Methocat nigrior n. sp.
\}.-Deep black, shining: pubescence short and black: clypens tuberculate medialls; head with distinct punctures, those on vertex larger and more separated; antennæ stont (last joints missing) ; thorax with strong punctures, those on upper surface well separated; middle segment rugoso-reticulate, practiablly as in M. stygia. posterior surface transversely rugose : abdomen with tolerably distinct, sparse punctures, finer than in stygia; wings a little infuscated. Length $12 \frac{1}{2} \mathrm{~mm}$.

State of Washington. One specimen. This is a much blacker insect than M. stygia, which has a grayish appearance.
3. Meihocet bicolor Say.

Methoca bicolor Say, Bost. Jourmal Nat. Hist., i, 299, $\mathcal{Y}, 1836$; Blake, Tr. Am. Ent. Soc., xiii, 279, Q, 1886.
I have only seen specimens from New Jersey (June and July) and Kansas, but have no doubt it is generally distributed as M. stygia; Provancher records it from Camada.
4. Methocat californieat Westw.

Methnca californiea Westwood, Tr. Ent. Soc. Lond., 1881, 133, 9.
California. I am inclined to regard this as a variety of bicolor in the absence of California specimens. I have a New Jersey example, which I regard as bicolor var., which agrees perfectly with Westwood's description.

## TELEPIOROMYIA Guérin.

This genus was described from Chile and Patagonia, and Ashmead recently records a species from California, which, while agreeing with most of Chérin's generic description, yet differs in having the claws supplied with a sharp median tooth internally, not with too teeth as in Telephoromyia. I am now inclined to regard my Telephoromyia pumicea from Brazil, with eleft claws, as not representing Telephoromyin. It is certain that panicea and anthrucina do not belong to the same genus.

1. 'Telephorinyia aniliracinat Ashm.

Telephoromyia enthracinu Ashmead, Psyche, 251, \}, 1898.
California: Los Angeles; Washington. This is coal black, with the elypeus and inner orbits yellowish.

GHATOMETOIA Ashmead.
Glyfometopa is a representative of the true Thymnine differing from Myrmosa, Morsyma and Methoca by the broadly flattened legs. It closely resembles the figure of Bradynobrenus Gayi, given in Gay's Historia de Chili, but, aceording to the description of the latter, the number of joints of the labial and maxillary palpi is different. It is interesting to note, that while Spinola describes the thorax of Bradynobcenus as bipartite, the figure shows it to tripartite.

1. Glytumetopat anmericanat Ashm.

Glyptometopa americana Ashmead, Psyche, 251. , 1898.
California: Alameda County.

## ADDENDA.

[Note.-After the present paper had been so far printed as to not allow insertion iu their proper order, the following three species were found to have heen omitted from the catalogne of specien, although included in the synoptic table.]

89a. Mutilla Foxi Ckll.
Sphxrophthalma Foxi Cockerell, Ent. News, v, 199, §, 1894.
Mutilla foxii Dalla Torre, Catal., viii, 41, 1897.
Mexico; New Mexico.
896. Mntilla filvohirta Cress,

Mntillu fulvohirtu Cresson, Proc. Ent. Soc. Phila., iv, 433, §, 1865.
Spherophthalmu fulrohirta Blake, Tr. Am. Ent. Soc., xiii, 219, چ., 1886.
Colorato; New Mexico.
s9c. Mulilla Townsendi Ckll.
Sphærophthalmı Townsendii Cockerell, Ent. News, v, 199, §, 1 s94.
Mutille townsendii Dalla Torre, Catal., viii, $92,1897$.
Arizona; New Mexico.
149a. Mnillat Ashneadii Fox.
Photopsis nanus Ashmead, (nee Mutilla numa Smith), 'Tr. Am. Ent. Soc.. xxiii, 181, §, 1896.
Arizona: Thesom.
